Stone, brick, steel, 2½ stories and basement, 30x140 feet, slate and tile roof, oak, pine floors, plumbing, electric light, metal lath, rolled steel sash, bond, ornamental iron work (heating, oak floors reserved). Contract awarded William Francis, Wilmington, Del.

(Continued from page 568)

The more important properties of concrete units are discussed and some of the advantages of their use in masonry building construction are set forth. Concrete block, tile, and brick have been defined and the recommendations for the standardization of sizes of the several types of units to avoid waste are given. The recommended standard sizes adopted are given as well as the large number of sizes in present use. This comparison shows that by maintaining definite standards of size for the units a large saving will result in an outlay for machinery, molds, and pallets, as well as the stock to be carried in yards.

Various materials widely used in the manufacture of concrete products are described in detail. The questions of proper size and quality of both coarse and fine aggregates are discussed and the use of admixtures, facing materials, and coloring processes are outlined. The need of careful proportioning, the proper time of mixing, the methods of molding, and the several means of curing are discussed at some length. The requirements for concrete units are dealt with from the structural, architectural, and fire resistant viewpoints. The methods for conducting tests of concrete products and the proper interpretation of data from test reports are outlined.

Factors affecting the financing of a concrete products plant are considered from an economic standpoint and suggestions are made to prospective investors to investigate fully all local conditions

which may affect the life and successful operation of a plant.

The circular proper is followed by a bibliography of books, technical papers, and periodicals dealing with various phases of the manufacture of these units which will be of particular interest to those contemplating entering this line of work. Several specifications are also given from the standards of the American Society for Testing Materials governing the quality of aggregates and the method of testing, together with the American Concrete Institute specifications for concrete block, tile and brick.

Those desiring copies of this paper should write to the Superintendent of Documents, Government Printing Office, Washington, D. C., for Circular No. 304 of the Bureau of Standards. The price is 20 cents.

Thousands of people have inspected the four prize winning demonstration houses built in four of the large market centers of the United States by the Lehigh Portland Cement Company; and building supply dealers and concrete products manufacturers throughout the country are applauding this elaborate campaign inaugurated to stimulate their business and to sell concrete masonry construction to the public.

The Lehigh Portland Cement Company last fall conducted a national architectural competition offering more than $4,000 in prizes for the best designs of small houses of concrete masonry construction. A distinguished Jury of Awards selected 28 plans from the hundreds that were submitted by prominent architects from coast to coast, and four of these prize winning designs have been built, furnished, equipped and opened to the public in New York City, Chicago, Kansas City and Birmingham.

The Lehigh Company set out to accomplish four things in this campaign and these four things have come to pass. They desired first to render a real service to dealers by increasing the sale of all their materials, lumber, sand, and roofing materials as well as cement and concrete products. This was planned with the full realization that if the sale of lumber and sand was stimulated for home building purposes, the sale of cement and concrete products would equally rise. This in turn would benefit the concrete products manufacturer. Second, to enlist the cooperation of the architectural talent of the country, through the national small house competition, to the end that there would be available expert small house plans of masonry construction for the use of the home building public. A second object of this phase of the undertaking was to impress on the public the necessity of competent architectural supervision of the details of residence construction. Third, to secure new dealer co-operation, and fourth, to demonstrate to architects, builders and the public, through the building of the four houses, the possibilities and practicability of the use of concrete masonry construction. The campaign has just closed and it can be said that all four of these objectives have been accomplished.

A great interest in masonry construction in the home building field has been aroused in the four demonstration cities and in many other cities throughout the country where the Lehigh prize winning designs are being built by local dealers and Realtor-Builders individually or in co-operation with other interests. For dealers in cities far removed from the demonstration cities, the Lehigh Company has prepared a detailed procedure including various dealer "helps" to assist in putting over such campaigns.

More than 60,000 people stood in line in New York City (Bronxville), Chicago, Birmingham and Kansas City, waiting to go through the demonstration houses and these people, according to the Lehigh officials, were the best kind of prospects for all the materials used in the houses. A careful analysis was made of the attendance in all four cities by the Lehigh Company that makes the interesting statement in a report covering the attendance, that there is a trend on the part of the public to study the actual construction of homes. This is a good omen for manufacturers of quality materials who have heretofore been distressed at the apparent lack of interest of the home buying and building public in anything but the exterior appearance or the view from the dining room window. It is also interesting that this attitude on the part of the public is evident in all four cities representing distinct and different parts of the country, the east, the north middle west, the south middle west and the south.

"Visitors to the Lehigh homes were not curiosity seekers," states the Lehigh report. "On the day of the opening of the Chicago house, rain fell throughout the day and 1800 people journeyed to this Chicago suburb to inspect the house from the hours of one p. m. and nine p. m. There was apparently a desire on the part of visitors to know more about materials entering into home construction.

These conclusions were based in part on the great interest of visitors in parts of the houses that were more or less technical to the layman. In all four of the houses, a section of the wall was cut out showing the construction, the use of metal lath and the proper application of the exterior and interior plaster. In each house in a glassed-in compartment cut out on the outside wall was placed an electric heater generating a heat of 178 degrees. A thermometer, placed in this cut out section directly against the concrete block registered 76 degrees, demonstrating in a graphic way that the wall did not permit the transfer of temperature. On the outside surface of the same wall in each house, a stream of water was kept playing and the reverse side was shown to the visitors to be perfectly dry, indicating to them that water does not penetrate this type of construction. A thorough check of the attendance showed that these walls were closely examined by visitors in all four cities.

Full page, double spread, color advertisements were used prior to and during the building of these houses by the Lehigh Portland Cement Company in national publications, calling attention to the construction of these prize winning designs and identifying Lehigh local dealers with the Lehigh Blue and White sign as reputable merchants in all types of materials. The national advertising carried coupons to be clipped for a booklet published by the Lehigh Company containing the 28 prize winning designs, which, according to the Jury of Awards, are the best small home designs ever assembled. More than 30,000 requests were received in three months time for this booklet and these names were forwarded to local dealers. Good live prospect names. In the four cities where the demonstration houses were built, the local newspapers

co-operated and carried the undertaking as a news feature, giving publicity to the local dealers.

Private showings were held in each city for select lists of contractors, builders, dealers and concrete products manufacturers a week before the formal opening of the houses and this attendance was also good. Salesmen in each city were given an intensive training before the opening of the houses so they were prepared to explain the features of the construction of each house and to answer the many and varied questions of visitors. A list of more than 100 possible questions and answers was made up by the Lehigh Company and given to salesmen to study and these questions covered all phases of construction likely to interest prospective home-builders.

The first prize award for a six room concrete masonry house designed by Angus McD. McSweeney, of California, was built in Bronxville, New York City, and in a reversed position in Kansas City. The New York contract was awarded to J. H. Stoltz, of Bronxville, Laylord Lyon was the supervising architect and R. W. Stofflet, and F. A. Blatte, of the Lehigh Company, the supervising engineers.

The second prize six room house, won by H. A. Surman, Detroit Architect, was built in Winnetka, a suburb of Chicago, Ill. This contract was awarded to Paul A. P. Mueller & Son, and Granger and Bollenbacher of Chicago were the supervising architects, H. B. Emerson was the supervising engineer.

The first prize five-room bungalow designed by John Floyd Yewell and Harry Starr, New York architects, was built in Birmingham by E. R. Maynord. George P. Turner, was the supervising architect and W. B. Clark the supervising engineer.

The Kansas City house was built by Joseph F. Gier; Buckley and Van Brunt were the supervising architects and L. T. Fossum the supervising engineer.

Further extending the ramifications of this program, the Lehigh Portland Cement Company is now preparing for fall publications, an illustrated book to be titled "Building Better Homes," said to be the first publication of its kind covering detailed home building data in simple language. This book will contain an accurate account of each step in the construction of each of these four prize demonstration homes, costs data, photographs of construction details, and other real information as to how to proceed in building. This book is being written in a way that will be interesting to architects, contractors, concrete products manufacturers and the general public. It will also contain a comparison of the procedure followed in building the four Lehigh demonstration houses and it will be distributed through national advertising and through local dealers.

Here is an organization expending thousands of dollars in an educational undertaking that has benefited other manufacturers in the home building field and at the same time earned enormous prestige for themselves.

SOME OBSERVATIONS ON WAGE LEVELS

Back in 1899 the average earnings of the American worker amounted to $426 per year, according to a statement issued by the National Association of Building Trades Employers. Twenty-four years later or in 1923, the figure had increased to $1254 a year or nearly three times as much. During the same period of time the cost of living rose to about twice its former level. The worker today, however is about 50 per cent. better off in "real wages" than the worker of 25 years ago.

"Organized labor has repeatedly tried to claim all the credit for bringing this condition about," the statement continues. "While it is true that the labor movement has been partly responsible for the change, the greater share of credit must go to the fact that increased production made possible by more mechanical power per worker makes high wages possible.

"It is perfectly obvious that increasing production is the only possible means for bettering the position of the wage earners. It is to be regretted, however, that this principle is utterly disregarded by such a vast number of workers in industry.

"It does not take any great amount of reasoning ability to arrive at the conclusion that a horizontal reduction of production must necessarily carry with it an equivalent increase in production cost. If wage rates remained the same the increased cost of living brought about by low production would bring the 'real' wage figure down in exact proportion to the decrease in work done.

"We are rapidly approaching the time in this country when mass production made possible by the use of labor saving machinery will make it possible for all the needs of the human race to be produced in less working time than is now required. The only way to hasten that time is to combine improvements with hard work. That will bring down the cost of commodities thus further increasing the 'real' wage of the workers—the only kind of a wage increase that is of lasting benefit to every one."—*The Associated Contractor.*

HOW MUCH FOR HOUSE RENT

A study of housing somewhat new and still pioneering in settled tests and guides, by Charles T. Moffet, shows that the English spend approximately one-sixth of the family income for unheated quarters; Americans spend approximately one-fifth. For heated living quarters the American ratio to family income is approximately one-fourth. Out of this study we reach the ground that a family should not spend beyond 20 per cent. of income for unheated quarters; 25 per cent. for heated. Should they be willing to accept less costly quarters, their savings are likely to be more than the average and their gain in wealth more consistent and rapid. It follows, then, that a family with an income of $1,500 per year may reasonably pay a rental in unheated quarters of $300; $2,000 income, $400 rent; $3,000 income, $600 rent; $4,000 income, $800 rent; $5,000 income, $1,000 rent; $10,000 income, $2,000 rent. From this schedule it is not difficult to formulate the cost of a home that one with any definite income may properly buy and maintain. At the rather steady going rate of money interest upon real estate of 6 per cent. and a 2 per cent. depreciation reserve (which may be used for amortization of incumbrances), we may say $300 annually may be capitalized at 8 per cent. into a $3,750 home. Likewise a family havng an income of $10,000 a year may capitalize its $2,000 annual rent into a $25,000 home.—*Record and Guide.*

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

"ANTI-HYDRO" Keeps Elevator Pits Absolutely Dry

The concrete elevator pits in this building are permanently waterproofed with "ANTI-HYDRO". They are absolutely dry at all times.

No matter how large or how deep you build concrete pits, you can rely on "ANTI-HYDRO" to keep them dry. It waterproofs concrete against any head of water.

ANTI-HYDRO is a liquid integral agent that mixes easily with the gauging water. Any unskilled workman can do it. It both hardens and waterproofs concrete in ONE OPERATION.

During the past 22 years, "ANTI-HYDRO" installations have circled the globe. Carefully kept records fail to indicate one unsatisfactory installation. Use "ANTI-HYDRO" on your next job.

As The Editor Sees It

SMALL HOME BUILDERS SHOULD EMPLOY AN ARCHITECT

Instead of increasing the cost of the house the trained architect not only saves one money but insures a better structure.

Architecture, from the standpoint of general public appreciation, stands mighty close to the bottom of the list of the professions. The rank and file of American small home builders have not yet come to understand just how important a part the architect plays in the construction scheme. The chief trouble is that they haven't rubbed elbows with him. The building contractor has been serving as architect for the small home builder altogether too long. He has rather effectually replaced the architect who, by a large percentage of the people, is regarded as an unnecessary luxury, the affectation of those who always insist upon being impressive, or the fad of the new or idle rich.

The real practical service of the architect, the assurance of pleasing design and convenient arrangement of the home, the requirement of specified materials and their proper application, the inspection and guarantee of good construction, the certainty that all will be required to be done according to contract and the specifications, all these things are beyond the ken of the average prospective builder. These are things which he has been used to seeing left in the hands of the contractor himself and entirely at the mercy of the contractor's honesty.

Another feature which has served to keep the architect and the prospective home owner from meeting, save on very rare occasions, is the constantly increasing practice of buying homes ready built rather than assuming the responsibility of building them. Speculative builders have become surpassingly active within the last few years the country over. Not always are they as satisfactory as they are numerous. A species of so-called jerry builder has developed in their midst; a builder who cheats in everything and who has cast suspicion upon them all.

Usually the jerry builder is his own architect. Too many of the speculative builders imitate him. The result is a growing doubt in the public mind about the value of the ready-built house. How disastrous this suspicion may become to the speculative builder as a class, and how beneficial ultimately to the architect through increasing his clientele, is a question open to conjecture. Unquestionably it is having its effect in increasing the popular interest in the architect and his mission.

More or less constant publication of house plans in the newspapers is also slowly bringing the attention of the public in general to the fact that there is really something worth while in the planning of the home. The old hit and miss home, built partly at one time and partly at another, with additions here and there to meet some temporary requirement, is swiftly passing out of the picture. People are coming to demand more of the conveniences and gradually are recognizing the fact that the architect's business is, to some degree, seeing that homes are provided with them.

So, everything considered, things are looking up a little for the architect, but they are yet far from being what they should in the small home field. And after all that is where the architect can really be of the greatest service, where he can be most valuable, for ordinarily the small home builder is the man who should get the best value for his money. He, of them all, can less afford not to get it, for usually he is putting into his

home all that he can rake, scrape or borrow, and mortgaging his future for more years than he cares to consider.

In almost every community there is an architect capable of handling the small home problem for his fellows without its making serious inroads on his more important work. Usually he is willing to do this and rarely will the small home builder find his employment a burden beyond his means. Certainly he will seldom have reason to regret the expenditure when he comes to look over the finished product and to compare it with some of the jerry-built homes in his neighborhood. The employment of an architect is always a good investment; it is just another kind of insurance upon which one realizes quickly.

An impression seems to be prevalent among a lot of people that the employment of an architect necessarily means a substantial increase in the cost of the home, as the architect will want to inject a lot of gingerbread trimmings and innovations in arrangement, all of which will be expensive. This is altogether an erroneous idea. The architect will carry out your ideas in planning the home; he will first of all be careful to suit you. Possibly he may offer suggestions as you outline what you desire, but they will be for the improvement of your general plan. Primarily his idea always is to give you what you want at the least possible cost.

Small home builders make a mistake in not having an architect supervise their housebuilding. The architects alone have been responsible for the tremendous improvement in the small home in recent years.—*Building Economy.*

REDUCING ACCIDENTS ON CONSTRUCTION OPERATIONS

LEO D. WOEDTKE, *Safety Director, Fred T. Ley & Co., Inc., and President of Springfield Safety Council*

The Construction Industry contributes from 15 to 20 per cent. of all industrial accidents, according to the statistics of both the Pennsylvania and the New York State Department of Labor. This is indeed a black eye and unworthy of the keen and courageous men who constitute the oldest and second largest industry of the world, taking second place only to agriculture and farming.

It is a safe prediction that if contractors, as a class, do not get busy voluntarily and do some genuine and consistent safety work and spend time and money on real effort, they will be forced to do so in the not distant future in an unpleasant and costly way, by legislation and labor unions, plus public sentiment.

Commissioner Hamilton, of the New York State Department of Labor recently stated in a public address, that the time was fast approaching when the Commonwealth would be obliged to require more genuine Safety Work on the part of the contractor. On this same platform, a representative of the New York State Building Trades advised that they had already been obliged to use their economic power and call men off of several jobs because of unsafe conditions not remedied upon complaint to the contractor.

The pity of all this is that the real public-spirited and progressive contractor who is doing his bit, will have to suffer along with the "Don't give a damn" type.

That general contracting, in its many branches, is considered as a high hazard by insurance companies is attested by the fact that higher rates are charged for construction work than for any other industry, and the contractor pays a very large percentage of his payroll for insurance premium. For this he has no one to blame but himself.

With the advent of Workmen's Compensation Acts and the development of Experience Rating Plans, the contractor practically makes his own rates, in that the regular manual rates for his classes of work are either increased through bad experience, or decreased through good experience.

Contractors who have maintained a Safety Department and carried on intensive and consistent safety work, have found that in addition to saving very large sums of money in insurance costs, they have also reduced labor turnover and increased efficiency through keeping trained men on important work without loss of time, and have also secured the profound respect of labor organizations, employes, their clients, and the public.

The contractor's safety program must necessarily begin at the very top, and once the chief executive is sold on this proposition he should delegate some one person in his employ to head up or direct the Safety and Accident Prevention work in his organization and right here let me emphasize strongly that it is not necessary to employ an additional man to do this work, nor is it necessary that the employe selected be a safety engineer,

Brick, steel, 2 stories, 100x29 feet, slag roof, elevators, copper work, general alterations, plumbing, heating extension, electric work. Oscar Degler, 1041A Walnut street, Reading, Pa., will build.

Y. M. C. A. Building, Lancaster, Pa. Architect, C. Emlen Urban, Woolworth Building, Lancaster, Pa. Owners, Y. M. C. A., care of architect. Fireproof, 4 stories, 69x60 feet, built-up roof, hardwood floors, hollow tile, roof ventilators, ornamental iron, iron stairs, tile and marble, metal lath, electric light. Architect ready for bids.

High School, West York, Pa. Architects, Witman & Royer, 47 East Market street, York, Pa. Owners, West York School Board, West York, Pa. Brick, steel, fireproof, 2 stories and basement, 174x60 feet, composition roof, maple and composition floors, hollow tile, safety treads, roof ventilators, steel sash, metal lath, ornamental iron (heating, plumbing and electric separate). Owners taking bids due September 22nd.

Theatre, Pottsville, Pa. Architect, William H. Lee, 1505 Race street, Philadelphia. Owners, Chamberlain Amusement Co., Pottsville, Pa. Brick, steel, reinforced concrete, hollow tile, steam heat, electric light. Architect taking bids due September 29th.

Grade School, Carlisle, Pa. Architects, Lawrie & Green, 116 Locust street, Harrisburg, Pa. Owners, Carlisle School Board, Thomas Vale, secretary, Carlisle, Pa. Low bidders: H. A. Lackey, Carlisle, Pa., $74,000. Plumbing, Frederick & Co., Carlisle, Pa. Heating, J. H. Bowman, Penbrook, Pa. Electric, A. G. Crunkleton Elec. Co., Greensville, Pa.

Junior High School, Mansfield, Pa. Architects, Lawrie & Green, 116 Locust street, Harrisburg, Pa. Owners, Mansfield School Board, care of architects. Lowest bidder: J. C. Snyder, Selinsgrove, Pa.

Grading, Paving Walks and Drives, Upper Darby, Pa. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Delaware County Hospital, care of Dr. T. Clawson Beswick, Stonehurst, Pa. Architect taking bids, due Sept. 16th.

Road Work, Pennsylvania. Owners, Department of Highways of Pennsylvania, Harrisburg, Pa. Owners taking bids, due Sept. 24th at 10 A. M. Plans $2.50 set.

Allegheny County, R-257, A-1322, N. Fayette Township, 8,265 feet. One course reinforced concrete. Certified check $2,000.

Allegheny County, A-3756, CcCandless Township, 5,240 feet. One course reinforced concrete. Certified check 1$,500.

Armstrong and Indiana Counties, R-319, A-4137-4103, Armstrong and South Bend Townships, Shelocta Borough, 22,248 feet. One course reinforced concrete. Certified check $3,000.

Beaver County, R-278, A-4359, Brighton Township, 4,500 feet. One course reinforced concrete. Certified check $1,500.

Clarion County, R-214, A-3151B, Monroe Township, 5,107 feet. One course reinforced concrete. Certified check $1,500.

Clearfield County, R-62 Spur, Curwensville Borough, Pike and Penn Townships, Lumber City Borough, 33,266 feet. Bituminous surface course treated macadam. Certified check $4,000.

Crawford County, R-89, Sec. 4, W. Mead Township, 2,858 feet. One course reinforced concrete. Certified check $1,500.

Dauphin County, R-339, A-4160-4161, Lykens Township and Gratz Borough, 19,743 feet. One course reinforced concrete. Certified check $2,500.

Dauphin County, Plaza at Capitol Building, Harrisburg, 1,443 feet. One course reinforced concrete. Certified check $1,000.

Delaware County, A-4263, Thornbury Township, 6,000 feet. One course reinforced concrete. Certified check $2,000.

Delaware County, R-132, A-4381, Trainer Borough, 4,512 feet. One course reinforced concrete. Certified check $1,500.

Delaware County, R-133, A-4382, Upper Darby Township, 6,200 feet. One course reinforced concrete. Certified check $2,000.

Delaware County, R-516, A-4383, Radnor and Haverford Townships, 15,312 feet. One course reinforced concrete. Certified check $2,500.

Fayette County, R-247, Sec. 9, Fayette City Borough, Washington Township, 5,539 feet. One course reinforced concrete. Certified check $1,500.

Elk County, R-99, Spur A, A-3910, St. Mary's Borough, Benzinger and Fox Townships, 19,4955 feet. One course reinforced concrete. Certified check $2,500.

Huntingdon County, A-2845-2828-A, Broad Top City Borough, Carbon Township, 7,994 feet. One course reinforced concrete. Certified chek $2,000.

Montgomery County, A-4271, Abington Township, 4,287 feet. One course reinofrced concrete. Certified check $1,500.

Northumberland County, R-1, A-3075, Jackson and Lower Augusta Townships, 10,833 feet. One course reinforced concrete. Certified check $2,000.

Pike County, R-167, Lehman, Delaware and Dingham Townships, 23,319 feet. One course reinforced concrete, 2,905 feet grading and drainage. Certified check $3,500.

Potter County, R-318, A-4285, Genesee Township, 10,560 feet. Bituminous surface treated macadam. Certified check $2,000.

Road Work, Pennsylvania. Owners, Pennsylvania Department of Highways, Harrisburg, Pa. Low bidders on work received September 88th.

Schuylkill County, R-464, A-3925, 3926, Gilberton and Shenandoah Boroughs, W. Mahanoy Township, 8,576 feet. Bituminous surface course on broken stone base. Rudolph & Delano, Tamaqua, Pa., $101,693.90.

Co., 1733 North Marvine street, Philadelphia.

Miscellaneous Construction News

Church, Georgetown, Del. Architect, Norman Hulme, 1524 Chestnut St., Philadelphia. Owners, Wesley Methodist Episcopal Church, Georgetown, Del. Stone, cut stone, steel, 1½ stories and basement, 101x48 8feet, slate roof, maple, pine and cement floors, steam heat, electric light, bond, ornamental iron work. Architect taking bids due September 21st.

Hospital (add.), Frederick, Md. Architect, Edward Leber, Hay Building, York, Pa. Owners, Frederick City Hospital, Miss Nies, superintendent, Frederick, Md. Fireproof, 3 stories and basement, 40x96 feet, composition roof, composition and rubber floors, hollow tile, elevators, safety treads, roof ventilators, ornamental iron, iron stairs, skylights, tile work, metal lath, heating extension, electric light. Plans in progress.

Rectory (alts. and add.), Wilmington, Del. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, St. Ann's Roman Catholic Church, Wilmington, Del. Architect taking bids due September 17th.

The Montgomery Iron & Steel Company, fabricators of steel, ornamental iron, miscellaneous builders' iron and vault lights, formerly of 918 West Berks Street, Philadelphia, have moved their offices to Duncan, Church and Sepviva Streets, Philadelphia.

There will be no interruption in the operation of the plant ae 918 West Berks Street, as they will fabricate at their new plant as well as at the old plant while in the process of moving.

With a larger and more modern plant, increased facilities in equipment, together with a siding on the Pennsylvania Railroad, more advantageous service than heretofore can be given.

The entire plant, as well as the offices, will be at the new location after October 15th.

Harry A. Whartenby, ornamental iron, structural steel and art bronze, formerly of 10 South Eighteenth Street, Philadelphia, has moved his offices and shop to 1823 Brandywine Street, Philadelphia, where additional space will allow him to carry a complete stock of standard builders' iron work.

M. M. Boonin, architect and engineer, has moved his offices from 17 South Seventeenth Street, Philadelphia, to 23 South Sixteenth Street, Philadelphia.

Basford Erickson & Co., roofing and sheet metal contractors, have incorporated their business and will continue under the name of The Erickson Company.

W. B. Shepherd is President; Daniel J. Maguire, formerly Vice-President and General Manager of Warren-Ehret Co., is Vice-President, and A. B. Erickson is Secretary and Treasurer.

The office of the plant will be at the old address, 5942 McCallum Street, Germantown, Philadelphia.

(Continued from Page 584)

as all he really needs to start with is the authorization and backing of the chief executive to create his standing with the superintendent, foreman, and workmen, so as to secure the support and co-operation of the men in the field.

With this necessary step taken, the problem resolves itself into two main parts: namely, Mechanical Safeguarding and Safety Education. As to the first, a thorough inspection of the contractor's machinery, equipment and tools, with a view to installing safeguards where necessary or advisable, is all that is required, and the recommendations of the safety director will, of course, call for the co-operation of the head of the eqipment plant. Then the head of the firm must be willing to stand for the expense of the safeguards or changes required. The mechanical safeguarding of equipment used in the construction industry is after all a simple matter involving only

the willingness on the part of the construction firm head to spend the small amount of money involved and the close study of the mechanical safeguarding needs by the person directly in charge of the purchase and supply of the equipment to the job. I will be glad to go into details of this with any one who is interested.

Assuming that the firm has done its part on mechanical safeguarding of equipment before it goes to the job, let us start right on the job itself for, after all, that is where the accidents happen and not back in the office.

MECHANICAL SAFEGUARDING WHICH CAN BE DONE ON THE JOB HOISTING ESUIPMENT: The job should see to it, if it becomes necessary to temporarily remove any guards, that they are put back into place without fail before the equipment is put in use again.

STEAM BOILERS: The job should be responsible for installing the detachable guage glass guards as well as all fittings. The job superintendent or master mechanic should see that all attachments are in working order and are tested at least once a week and should comply with all state requirements wherever the job is located. I recommend that the blowoff cock be opened at least once a day, preferably at the time of steaming up in the morning, so that any scale or sediment which would have accumulated the previous day and night can be blown off. This will insure better steaming and preservation of the boiler as well as prevent accidents.

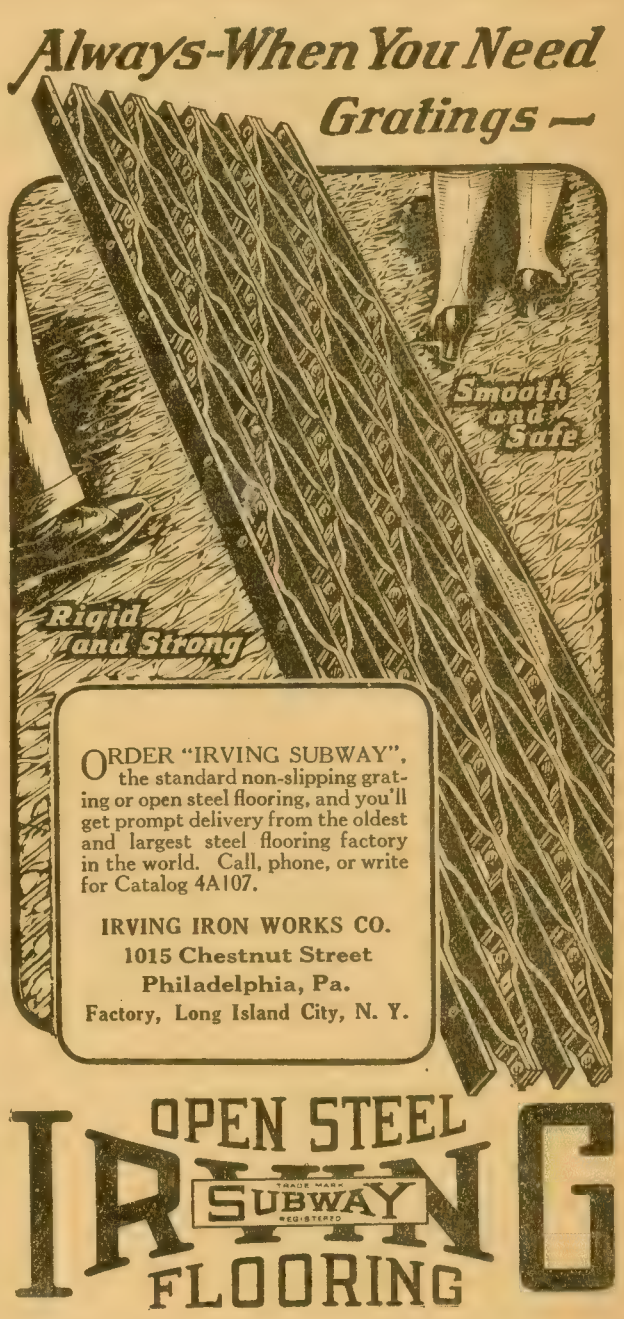
CIRCULAR SAWS: The job should provide a definite stop on swing saws to prevent the top of the saw from travelling beyond the front edge of the working table. It will also be necessary to chain the counter-weight to the frame of the machine or other convenient fixed object to eliminate the possibility of its falling on the operator. On treadle operated swing saws, the job should install a strap over the treadle so arranged as to prevent accidental operation of the treadle. The job must also provide adequate guards for belts, pulleys, and revolving projections in connection with the driving of the different types of saws.

Complaints are often made regarding saw guards removed and not put back in place, as well as equipment returned with guards missing. The job superintendent should be held responsible in such cases.

JOINTERS OR BUZZ PLANERS: The Equipment Department should do whatever guarding of belts, pulleys and revolving projections is possible on the jointers and planers, but the job should provide the guarding of belting and shafting when planers are driven from countershaft.

BUILDER'S ELEVATORS: The job should see to it that the unused sides of the elevator are properly boarded up and that the openings to elevator walls are properly guarded as conditions on the job require.

ELECTRICAL EQUIPMENT: The proper safeguarding of electrical equipment, wiring, switch and fuse cut-outs, must be taken care of by the job and this is controlled more or less by local building codes with which the job must become familiar.



GASOLINE AND KEROSENE CANS: The job superintendent should see to it that a responsible person is in charge of handling gasoline and kerosene as serious accidents will certainly result if lanterns are filled with gasoline by mistake. The job should be expected to stencil or letter "Gasoline or Kerosene" in fairly large type on any cans they purchase or provide themselves.

ENGINE DRIVEN CEMENT MIXERS: The job should be responsible for keeping the doors of such housing closed when the operator is not working on the engine, with the exception of such doors as must be left open for air.

AUTOMOBILE TRUCK SIGNS: These signs caution persons from riding on the trucks and the job superintendent should be responsible for their being in place.

CHISELS AND HAMMERS, DRILLS AND BULL POINTS: The job must keep all such tools properly dressed as well as all handles wedged or tightened, and the job blacksmith or whoever dresses such tools should be instructed and followed up in this regard.

PORTABLE LADDERS: The job should be required to test all ladders periodically and discard or destroy any unsafe or unsound ladders. Under no circumstances are ladders to be painted with lead and oil, which treatment covers up defects or weak spots that would otherwise be noticed. On receipt of machinery or equipment by the job, same should be checked and if parts are missing the same should be reported immediately to the equipment department. It is also of great importance that the job, when returning equipment, sees to it that all detachable safeguards are properly boxed and shipped with all equipment, whether the equipment is being returned to the contractor's general storeyard or being shipped to another job.

SAFE EDUCATION ON THE JOB: As to the second part, namely safety education, this takes in practically all that must be done right on the construction operation, and includes both matters completely under the control or in the power of the superintendent and foreman as well as training both the skilled and unskilled workmen themselves to think and act safely. As a few suggestions along this line, I offer some of the things I have worked out myself over a period of years as director of safety for Fred T. Ley and Co., Inc.

Semi-monthly safety letters to each job superintendent with information, suggestions, and friendly criticisms; including not more than four fresh or new safety bulletins or posters, which can be secured from the National Safety Council and occasionally from some insurance companies. The use of homemade bulletins, blue printed or photographed. Occasionally, special articles on some one thing, such as "Chains, ropes and cables," "Safe Loads," "Dropsy or Butter-finger Habit," "Fire Prevention," "Stagings," "Goggles," "Salamanders," etc. Danger tags, with the firm's name thereon, supplied in small tin containers fastened on the inside of tool boxes in the blacksmith shop tool house, field office, etc., which are easily available for tying on the defective or condemned tools, machinery or equipment. Suggestions for stout, sound runways, platforms and stagings, with proper toe boards, hand rails, etc.

Suggestions and education on proper piling and placing of lumber, brick, pipe, cement, stone, tile, etc. Suggestions or recommendations on good housekeeping cleaning aisles, passageways, etc., from debris, turning down protruding nails and removing causes of stumbling and falls.

There is much that could be said, that space does not permit, on three of our usual causes of accidents in the construction game which come under the head of stumbling, falls, slipping and dropping material, all of which, however, really come under the one head of "Good Housekeeping" and if the contractor, who is beginning safety work on an organized basis, will devote his energies to good housekeeping, he will cover, at least, half of the ground involved in accident prevention. One final development, which usually comes later, but which, in my opinion, should be put into operation at the very beginning is the job safety committee. I have tried this out in a number of ways, and for the average construction job would recommend as follows:

Print half a dozen simple and intelligent safety rules on a small card to hand to the new employe at the time you give him his brass check. This will start him right, with a proper respect for your interest in accident prevention and in the important fact that you, as an employer, are interested in his physical welfare and this will secure his honest support and co-operation. That each job have a Safety Committee to consist of the job superintendent at the head and not less than two additional men, either foremen or straight-time men, this committee to pay particular attention to and make observation of all hazards present on the work and if such come within the scope of their authority, to either give such directions or orders as will eliminate the hazard, or if beyond their authority, to make immediate report to the superintendent for his action. In addition to this, the members of the committee shall make periodic safety inspections of the entire work, and report to the job superintendent with any recommendations they see fit to make.

The superintendent, together with the members of this committee should meet at least once a week, for fifteen minutes, or as long as may be necessary to review their work and to analyze any accident which had occurred during the previous week, and to take whatever action may be necessary to prevent a recurrence of accidents on the job, or to try to prevent any accidents that may occur due to conditions found. Some contractors have used a button marked "Safety Committee" for the man doing that work, with good results. It sounds good to me and I am going to try it out. The safety director in the office should receive a brief memorandum of the minutes of such safety meetings, so that he may co-operate with the job by suggestions, advise or, if necessary, by interceding with the head of the firm for whatever might be necessary to bring to his attention the matters of expenses or change of policy.

In conclusion, I would heartily recommend that each and every contractor join the National Safety Council and through it, of course, the Construction Section of that body, so as to be in constant touch with the development of accident prevention in general and in the construction industry in particular, as well as to receive the benefit of a steady supply of new safety bulletins, safe-practices pamphlets, the monthly magazine, *National Safety Council News* and the interchange of information and ideas from the many other construction firms who constitute the Construction Section.

SHEET STEEL GARAGES ARE FIRE TESTED

Two tests to determine the stability under fire conditions of all-steel garages and the hazard to adjacent buildings, accompanying a complete burning-out of contents, have been made at the Bureau of Standards at the request of the Sheet Steel Trade Extension Committee, which built the garages for the tests. The minimum allowable distance between such garages and the lot line, or adjacent buildings, varies widely in the building codes and fire regulations of different cities.

The interpretations of the results, the Bureau explains, depends on the assumptions relative to the degree of hazard to which a minor building, such as a garage, may expose a major building or another garage. If exposure of a degree that can be controlled with minor fire-fighting equipment or effort is to be permitted, it is apparent, the Bureau says, that the all-steel garage can be placed as close as one foot from the lot line for all walls except the door side, provided any windows in the wall next to the lot line or exposed building have fixed metal frames glazed with wire glass. Under the same conditions an all-steel garage would be no hazard to a similar garage two feet away. These tests, as well as some preliminary trials with the burning of gasoline in automobile gasoline tanks, disclose, the Bureau reports, that there is little probability of explosions occurring—if pressure develops because of vaporization of the gasoline, it is likely to be relieved before a high intensity is built up by failure of the joints of the tank, forcing of the carburetor, or vacuum tank, or melting of soldered connections.

MARKETS FOR SHORT-LENGTH LUMBER SURVEYED IN NEW PUBLICATION

Refrigerators, ice cream cabinets, automobile export boxes, sectional and ready-cut buildings, coffins, caskets, garage door panels, tanks and vats, screen doors, stepladders, advertising sign panels, washing machines, beehives, toys, agricultural implements, cable reels, and commercial fixtures are some of the leading commodities whose manufacture offers broad outlets for short-length lumber, according to an illustrated circular just issued by the Forest Service, United States Department of Agriculture, entitled "Industrial Outlets for Short-Length Softwood Yard Lumber."

This new publication, Department Circular 393-C, stresses particularly the inability of the building trades to absorb the available quantity of short-length lumber, in spite of the fact that they offer the largest single outlet for short lengths, especially of worked lumber such as flooring, siding and ceiling, and end-matched softwood flooring and ceiling.

According to its author, "Industrial Outlets for Short-Length Softwood Yard Lumber" has been written in response to the demand of the lumber trade for information regarding the disposal of this material. In setting forth the facts obtained by the Forest Products Laboratory at Madison, Wisconsin, in a re-

cent survey of the situation, the author points clearly to the obligation of the lumber industry to take definite steps toward improving the marketing of short lengths. This may involve rather extensive remanufacturing at a sawmill to furnish material in multiples of the length the manufacturer requires. Information regarding the sizes that can be furnished, and also of the needs of the manufacturer, must be readily disseminated. Costs must be studied so that prices may be stable. The consumer needs not only the material cut to his needs, but also a reliable source upon which he can depend for regular supplies. In every way the producer needs to pay greater attention to merchandising. The problem is not an easy one to solve, the author points out, but experience shows that it can be solved very profitably for all concerned where the will to do so is present.

The survey made by the Forest Products Laboratory covered first in great detail the needs of 18 wood fabricating industries that use softwoods in considerable quantities and whose total annual consumption is 858 million board feet, or 56 per cent. of all the softwood lumber used in the manufacture of wooden factory products, exclusive of boxes, crates, mill-work and railroad cars.

Other industries, including less promising outlets for short lengths, were also surveyed, their annual use of softwoods totaling over 5 billion board feet. The report also covers the distribution of an undetermined quantity of softwoods by 76 wholesalers in 24 States, and 493 retailers in 15 States.

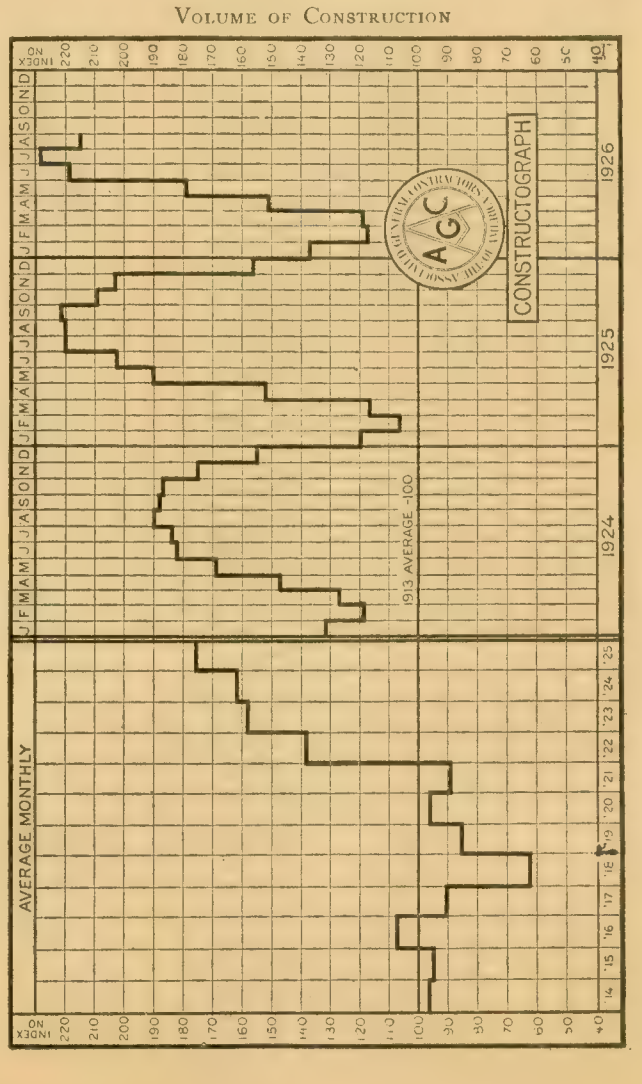
Minor outlets for short lengths include ironing boards, stove boards, battery boxes, drawing boards, shovelboxes, toilet tanks, cloth boards, core stock, and windmill vanes. Established outlets well worth cultivating are said to be box shooks and crating, including shorts for blocking, bracing and skids for shipping machinery.

A group of industrial uses for which only general information was obtained includes the railway car industry, millwork, woodenware, shade and map rollers, patterns and flasks, grain doors, fences, piano boxes, car racks, scale-beam boxes, and factory trucks.

The new booklet indicates that industrial consumers are potential buyers of three times the present considerable consumption of short lengths.

"Of equal importance to the lumber producer," says the publication, "is the indication that short lengths sold to the industries as ready-cut stock bring a price more on a parity with the price of long lengths than do short lengths sold for building construction."

A rather hopeful note is sounded by the author, who says: "The manufacturing and marketing difficulties are being overcome in a great number of cases, and examples of such progress among both manufacturers and consumers offer the most convincing evidence of what may be done.



"Cutting to size at the mill is being practiced with increasing frequency as the requirements for products such as stepladders, incubators, refrigerators, and sectional houses make themselves felt. Public agencies can accelerate the tendency somewhat by collecting and distributing helpful information, but the success of the movement in general depends upon the initiative of the lumber trade itself."

The booklet can be obtained free as long as the supply lasts from the United States Department of Agriculture, Washington, D. C., and from the Forest Products Laboratory, Madison, Wisconsin. It may also be secured by purchase from the Superintendent of Public Documents, Washington, D. C.

Construction operations are keeping abreast of the records set in 1925, the greatest building year in the history of the country. The total volume of operations carried on during the first eight months of 1926 is three per cent. larger than the corresponding volume registered last year, according to statistics compiled by the Associated General Contractors of America.

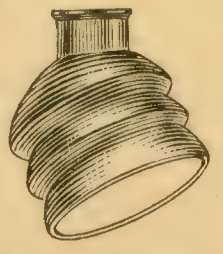
The margin over last year's figures was somewhat reduced during August when the total for the month dropped six per cent. below the figure set in July. This loss was compensated largely by the mass of work handled during July, when the previous "single month rec broken.

VOLUME OF CONSTRUCTION

The volume of operations recorded for August has been exceeded in only five months: July, August and September, 1925, and June and July, 1926.

The peak of operations last year was not reached until September, though figures set in each month following May and before December were above the previous high mark established in August, 1924. Construction activities this year have shown more of an inclination to spurt. This is shown by the fact that although only three months in 1926 have produced levels above that reached in August, 1924, the total for the first eight months stands higher than that achieved by the comparatively consistent trend of 1925.

The index number for August of this year, based on the average volume of construction in 1913 as 100, was 215. The July index number was 228.



HOW MUCH DOES HIGH GRADE MAN EARN?

Annual Earnings of Building Trades Mechanics Are Figured Out in Rochester, New York

By R. F. MILLER, Secretary, Rochester Community Conference Board

How much can a high grade building mechanic working for a well established contractor earn in a year? That is a question about which there has been considerable speculation but very little definite information. The hourly rates for the different tradesmen are well known, but the annual earnings, taking into account lost time and overtime, have never been accurately determined.

One of the strongest criticisms of the construction industry has been that it is subject to severe fluctuations due to

conditions and, as a result, building mechanics tend to be unemployed through a considerable portion of the year. In recent years there has been a widespread movement to lengthen the building season by stimulating construction work throughout the entire year. Just how successful these efforts have been and how they have been reflected in the earnings of the high grade, steady, reliable men in the building industry has been a mooted question.

The Rochester Community Conference Board, a semi-public fact finding agency representative of all interests in the construction industry of the city, has endeavored to give at least a partial answer to that question. Through the courtesy of 30 of the leading contractors, actual payroll figures for 1925 of several thousand mechanics of all types were available for study. From these were eliminated the temporary workers and all others not on the payroll of the concern throughout the year. This left a total of about 450 tradesmen who could be classified as regular, steady, high grade men. These men, by virtue of their superior ability and longer experience, represented the "cream" of the industry and obviously had first claim on employment.

Firms that co-operated in the study of the board are prominent concerns of the city and practically all have been established in business for many years. Moreover, 1925 was one of the most prosperous years that the building industry has ever enjoyed in Rochester. Building was at peak levels, employment was general and the industry was in the most advantageous position in recent years. Therefore, the earnings shown for the various tradesmen probably represent the highest it is possible for these tradesmen to earn. The earnings shown are in consequence not the wages of the *average worker,* but the earnings of the *best* mechanics working in a prosperous building year. This must be kept in mind in interpreting the figures.

This study provokes a number of interesting questions. What percentage of the total number employed in the building industry of Rochester can be classified as regular, steady men? In other words, what percentage of the men in the industry receive the earnings shown in the accompanying tabulation?

This question is not easy to answer, as conditions vary among the different contractors represented in the board's study. Some of the firms with well established businesses and a diversity of work showed as high as 50 per cent. of the average working force to be regular, steady men. Other firms showed as low as ten per cent. Taking into account all types of contractors and all firms represented in the study, the average firm showed approximately 25 per cent. of its average working force to be regular, steady men.

Another question is, what craft enjoys the most continuous employment? The above figures indicate that, by a wide margin, the roofers have the most irregular employment. Practically all the work of this craft is outside work, and, therefore, most subject to weather conditions. It is not possible to use winter enclosure methods, and other expedients which have been employed to advantage on other crafts, such as the masons and carpenters.

The high percentage enjoyed by the hoisting engineers and the laborers probably is explained by the large amount of overtime which these crafts enjoyed during 1925. The wide range between the high and low earnings also indicates that the high percentages may to some extent be discounted. The relatively high percentage enjoyed by masons also is significant, as workers in the trowel trades have been in years past one of the hardest hit by seasonal fluctuations.

Taking into account the varying number employed and the different wage scales for the various crafts, the weighted average* of actual earnings of the 325 mechanics included in the board's study, figures out $2500 per year, compared with a theoretical full year of $2650. This means that the regular leading mechanic averaged 94 per cent. of a full working year's earnings in 1925.

This is a gratifying showing and is the strongest kind of evidence that at least among the prominent concerns, the efforts toward stabilization are resulting in progress. The success indicated by the leaders shows what can be accomplished.—*American Contractor.*

---

*NOTE—The mechanics covered by this average and the respective number employed, upon which the weighted average is based, follows: Trowel trades, 900; Carpenters, 1600; Electricians, 500; Hoisting Engineers, 100; Iron Workers, 150; Painters, etc., 1000; Plumbers, etc., 500; Sheet Metal Workers, 400; Tile Setters, etc., 200; Total, 5400. Laborers, apprentices, etc., numbering 3000 or foremen are not included in the average.

Craft	No. of firms	Employes involved	High earnings	Low earnings	Average earnings	Hourly wage scale	Percentage* of full year's earnings
Mason Foreman	5	19	$4105	$2772	$3540

"ANTI-HYDRO" Keeps Elevator Pits Absolutely Dry

The concrete elevator pits in this building are permanently waterproofed with "ANTI-HYDRO". They are absolutely dry at all times.

No matter how large or how deep you build concrete pits, you can rely on "ANTI-HYDRO" to keep them dry. It waterproofs concrete against any head of water.

ANTI-HYDRO is a liquid integral agent that mixes easily with the gauging water. Any unskilled workman can do it. It both hardens and waterproofs concrete in ONE OPERATION.

During the past 22 years, "ANTI-HYDRO" installations have circled the globe. Carefully kept records fail to indicate one unsatisfactory installation. Use "ANTI-HYDRO" on your next job.

As The Editor Sees It

SUGGESTIONS FOR THE HOME BUILDER

J. F. SCHAEFFER, *Field Engineer, National Lime Association*

In this day of high prices the home builder welcomes any suggestion which will help to cut costs. In the construction of his home, the selection and proper use of materials followed by good workmanship, should be closely watched in order to secure satisfactory results. A good job in the first place will save money and give permanent satisfaction. "Jerry" buildings should not be tolerated, even in the face of a lean pocketbook, for repairs to cheap construction will very soon offset the initial saving.

All work should be done by a good mechanic, for the results of his work are constantly in evidence after completion. This is particularly true of carpentry, plastering and painting. Repairs due to poor or careless workmanship are difficult, unsatisfactory, and expensive.

Materials—There are a number of basic materials that are always used in the construction of a home. It goes without saying that lumber or brick should be the best quality for the use intended. No man wants a "leaky" house, either from rains or winds; nor does he want an unsightly home due to the selection of poor exterior or interior wall coverings. Paint that peels and shingles that curl are a liability. These are only a few items that go into the making of a house, which are generally selected with considerable care.

Other materials should not be overlooked, especially those for foundations, such as concrete, brick or tile. Cement, lime, sand and stone, or gravel are the basic materials for mortar, plaster and stucco, and the choice made is final, for repairs are more expensive than good work in the first place. Also a good job will increase the re-sale value of the structure, while a poor job will decrease the value and make it more difficult to dispose of the property.

Sand—The material thought of the least by the contractor is usually sand. However, it should be bought with great care. Many well-defined cases of concrete, mortar and plaster failures are due to poor sand. Building sand should be clean and well-graded from fine to coarse, free from organic matter and an excess of loam and silt. If necessary the mason's sand should be screened or much time will be lost by the brick layers in digging out pebbles when spreading mortar. While sand for concrete should be well-graded and clean, larger particles may be present without impairing the final product. Sand for plaster should be selected with as great care in grading and cleanliness as for mortar, and should all pass a number eight (8) sieve.

Coarse Aggregate—This is usually either well-graded or broken stone, ranging in size from about ⅜ of an inch to 1½ inches. In most gravels, material smaller than ⅜ of an inch is not detrimental, if in small quantities. If large quantities prevail, the gravel should be screened through a four (4) mesh screen. Particles larger than 1½ inch occur but are not detrimental provided there are other smaller sizes well graded down to about ⅜ inch.

Gravel or broken stone grading from ⅜ inch to about 1 inch may be used for almost any kind of concrete, but more frequently in thin walls, floors and sidewalks, while the large sizes are best used in heavy walls and footings. As with sand, the coarse aggregate should be free from soft particles, loam, leaves and sticks or organic matter.

Cement and Lime—All cement should be fresh and of a well-known brand. The

bags should be stored under cover as a protection from rain and moisture, and no hardened lumps should be used. A 94 pound bag of cement will make about 1 cubic foot of paste.

Either hydrated lime or quicklime may be used, and putty or paste prepared from each. With quicklime this is always necessary, but with hydrate, except for the white finish coat, the preparation of putty is not required. Quicklime paste is prepared by slaking the fresh lime in a watertight box, and run through a 14-mesh screen to eliminate any unburned particles or "core." The slaked quicklime should be allowed to age for a period of time, from 3 days to 2 or 3 weeks, or even as the plasticity and sand-carrying capacity of the lime putty are improved by ageing

About 27 pounds of quicklime will make 1 cubic foot of putty, while one barrel (180 lbs.) will yield approximately 7 cubic feet. Hydrated lime can be bought in 50 pound sacks, which are convenient to handle. The sacks may be stored like cement and kept ready for instant use. About 40 pounds of hydrate will yield 1 cubic foot of paste or putty when soaked with water.

Concrete—Good concrete for any purpose is easy to secure, provided the ingredients are clean, well mixed either by machine or by hand, and not too much water be used. A good proportion of materials for concrete for all general purposes is one (1) part Portland cement, two (2) parts sand, and four (4) parts gravel or crushed stone, mixed by volume or measure. An 8-quart bucket (10 lbs) of hydrated lime added to the mix with each bag of cement used will impart increased workability, uniformity and watertightness to the finished concrete. If mixed by hand it should be brought to an even color before the water is added, and if mixed by either hand or machine, only enough water should be used so that if a bucket full of mixed concrete is tipped over and raised slowly, the mass will not settle more than half the height of the bucket. For practical purposes, 6½ to 7 gallons of water for each sack of cement used will make the best concrete. The stones should be covered with mortar and no water should flow away from the mass.

The foregoing directions will give an easy-working, uniform and watertight concrete, so important in cellar wall and floor construction. When the concrete is placed in the forms it should be thoroughly tamped and spaded to make sure that there are no rough loose patches of stones next to the forms. If the walls are not completed in one day, the surface of the older concrete should be roughened and washed clean before continuing the pouring. Particular care should be exercised to see that the new material is thoroughly rammed up against the old surface in order to secure a good bond and prevent cracking.

All the materials, including the water, must be proportioned uniformly. The use of hydrated lime promotes uniformity and density by filling the voids in the cement, forming a seal to the passage of water. Its use also increases the durability and wearing qualities of the finished concrete.

Mortar—Mortar for brick, stone or tile should be thoroughly mixed, either by machine or hand, until free from streaks. First mix the ingredients together dry, then add fresh water to bring the mass to the proper consistency. One (1) measure (such as a shovel, bucket, box, wheelbarrow, etc.,) of lime putty or dry hydrated lime, to three (3) measures of mortar sand will make a good mixture for all ordinary work. It is more than strong enough for small house construction or an office building or apartment.

For basement walls, footings or any work below grade, one (1) measure of Portland cement to one (1) measure of lime putty or hydrate to six (6) measures of sand should be used. This will give a very strong, durable, and watertight mortar of sufficient strength to carry any load imposed upon it. This proportion may also be used for chimneys and the laying of all hollow tile and concrete block.

For ordinary walls of face or common brick, brick veneer or concrete block above grade, where a little extra strength is desired, use a mixture composed of one (1) measure of cement, three (3) measures of lime putty or hydrate, and twelve (12) measures of sand. The bricks should be laid on a full bed of mortar and the vertical joints filled. If the vertical joints are left open, there is a chance of water seeping through.

For cut stone work above grade the mortar should consist of one (1) measure of lime putty or hydrate to two and one-half (2½) measures of sand, to which add about one-sixth (1-6) measure of white stainless cement. For waterproofing the backs of the stone, they may be plastered with the same mixture.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., September 13, 1926. Sealed Proposals will be opened in this office at 3 P. M., October 5, 1926, for remodeling and enlarging the United States Post Office at McKeesport, Pa. Drawings and specifications may be obtained from the Custodian, or at this office, in the discretion of the Supervising Architect. James A. Wetmore, Acting Supervising Architect.

(Continued from page 600)

Plaster—There are several materials which may be used for interior plastering. Lime or gypsum are used most frequently. The suggestions which follow refer directly to lime, but if gypsum is used the proportions should be based on weight instead of volume. Detailed specifications are available from the National Lime Association, Washington, D. C. If quicklime is used it should be carefully slaked and screened into a water-tight box, where it should be allowed to soak or age from three days to two weeks. A longer time is even better. If hydrated lime is used, it should be soaked over night and the resulting putty or paste used as needed. Sometimes the hydrate is mixed directly with the sand and water to the proper consistency.

The mixture for the first or scratch coat should have one (1) measure (such as a shovel, bucket, box, wheelbarrow, etc.,) of lime putty or hydrate and one-fourth (¼) measure of Portland cement to three (3) measures of plastering sand. Three (3) pounds of loose cattle hair or fibre should be used with each 10 cubic feet of sand, and thoroughly mixed into the plaster. The plaster should be applied in such a way as to force enough material between the lath so that a good clinch or key is formed. The surface should be cross-scratched diagonally before the coat is dry. If wood lath are used, they must be nailed firmly to the studs and set about ⅜ of an inch apart. When the lath are spaced closer than ¼ inch there will be danger of the keys failing. If the wood lath has become dry before plaster is applied, it should be wet down before the first coat is put on. On metal lath lime plaster will effectively prevent it from rusting. The second or brown coat should contain the same amount of lime and sand as the first coat, but without Portland cement. No hair need be used in the second coat.

After this coat has been applied, time enough should be allowed for the house to dry out. If this is not done, there is a chance that the finish or white coat will crack. Plastering should be at least ¾ inch thick. For the finish coat, lime putty or paste should always be used and for the hard white finish, the putty should be gauged with Plaster of Paris in the proportion of about one (1) measure to every three (3) measures of lime putty. If a sand finish coat is desired, use three (3) measures of lime putty to three (3) measures of sand, gauged with one (1) measure of Plaster of Paris.

Never paint the white coat of plaster in less than a month after it has been applied. It may, however, be papered sooner. For plaster on concrete, brick, tile, concrete or cinder block, or gypsum block use the following proportions; The first coat should have about one (1) measure of lime putty or hydrate to two and one-half (2½) measures of sand, while the second coat should consist of one (1) measure of lime putty or hydrate to three (3) measures of sand. The surface to which the plaster is applied must be wet down first. The finish coat be mixed and applied as for lath backing. Plastering should be to at least five-eighths (⅝) inch grounds.

Stucco—An excellent stucco or exterior plaster may be obtained by using the following proportions: Mix thoroughly by volume three (3) measures of lime putty or hydrate, one (1) measure of Portland cement and ten (10) measures of sand for the first or scratch coat. Two (2) pounds of cattle hair or fiber should be mixed throughly with each ½ ton (about 10 cubic feet) of sand used. The thickness of the first coat should average ⅜ of an inch from the back of lath or beyond normal masonry lime. The second coat should be leaner than the first coat and may be mixed with the same proportions of lime and cement as the first coat but with thirteen (13) measures of sand, one (1) pound of hair or fiber being used in this coat. The thickness should also average ⅜ of an inch.

If the backing is wood or metal lath, a third or finish coat should be used. The proportions should be the same as the second coat, but with no hair or fiber. The thickness of this coat averages ⅛ to ⅜ inch according to kind of finish used.

In case the stucco is applied to a solid backing of brick, hollow tile, concrete, stone, concrete or cinder block, etc., it is customary to use only the first and second coats unless a pebble dash, rough coat or stipple finish is desired, which would require a third coat.

All stucco should be well worked, but should not be left with a slick, smooth surface.

Whitewash—The home builder can give a decorative touch to objects such as small structures, fences, cellars, ornamental stones for driveways, etc., by whitewashing. Whitewashes or cold water paints must be applied thin to obtain the best results. They should be applied with a large brush and the mixture spread on as evenly and quickly as possible. The lime paint may be prepared from either quicklime or hydrated lime and water, which has been allowed to soak before use with occasional stirring.

Various formulas are in common use for both exterior and interior work, which contain beside the lime, salt, casein or glue and sometimes formaldehyde.

A free pamphlet containing all the above formulas may be obtained by writing to the National Lime Association, Washington, D. C.

BRICK HOUSES ARE CHEAPER THAN ANY OTHER TYPE

Beginning practically on a par in first cost, they speedily outstrip all their rivals when the cost of upkeep is considered.

Does the home owner save money, under the cost of a substantial brick home, by accepting stucco construction over frame? This question arises in the minds of many persons about to build or buy a home. Builders in the city of Denver will tell you there is no saving. This is the result of a recent extensive cost survey made there by J. J. Stein, executive secretary of the Colorado Clay Products Association.

The average cost of 20 brick houses compared with the average cost of 16 houses finished with stucco over frame, showed that there was no difference in first cost. The difference in the ultimate cost would be, of course, entirely on the side of the brick house, due to its lower insurance rate, its superior resistance to heat and cold, and to its lower depreciation.

As a result of this investigation contractors, builders and realtors in general in the Denver district, who formerly built exclusively frame or frame and stucco houses, are turning to brick. This applies

chiefly to the suburbs of Denver, because in the city proper, with the exception of a small area, only fireproof exteriors are permitted by the code.

Perhaps the greatest obstacle which the brick industry has to overcome in the home building field is the misapprehension as to cost. Builders who are accustomed to other types of construction, and are not inclined to change their methods, discourage their prospects from building with brick by giving exaggerated estimates of the difference in cost. Often many architects, in perfect good faith we assume, will tell their prospects that there is a cost difference of from 15 to 25 per cent between a brick home and a frame home of equal size.

Here is the very emphatic way to disprove any such estimate. This example was used in Denver.

A brick house which sold for $5,000, exclusive of the lot, required $785 for all of the brick, mortar and labor for the exterior walls, porches, garage, chimneys and fireplaces. Even if there is a 10 per cent. difference between the cost of frame and brick, deducting 10 per cent. from the brick house cost would give the frame cost at $4,500. Since the only difference between a frame and a brick house is in the exterior walls and heavier foundations, it would mean that the frame enclosure for the house could not cost more than $285 to maintain the 10 per cent difference.

Every carpenter builder in the United States knows that he could not furnish the studding, sheathing, paper, clapboards or siding, nails and two coats of paint for the outside walls of a house of this size for $285.

To state it another way: Let us suppose that a given house could be built in frame for $10,000. The carpenter contractor tells his prospect that it would cost 25 per cent. more to build this house in brick. That would mean that the brick enclosure walls and the added four inches of thickness of the foundation walls would have to cost $2,500 plus the cost of the frame enclosure wall completed and painted.

Allow that we give back to the carpenter contractor his studding, sheathing, paper, clapboards and paint. Still his estimate of $2,500 would be away out of line because the total cost for brick, mortar and labor for the enclosure walls would not exceed $1,500 anywhere in the United States. The actual difference in cost between a house of frame and brick, that would sell in frame for $10,000, would not be more than 5 per cent., and in many parts of the country there would be no difference at all. To paint such a frame house once in two or three years would cost at least $250. Thus it will be seen that with two paintings the difference in first cost is overcome. The owner of the frame house will go on painting every two or three years, while the owner of the brick house will find his painting bill reduced to an insignificant item for the infrequent painting of sash and trim only.

—*Building Economy.*

EXTERIOR COLOR

BY GERTRUDE WOODCOCK

When a visiting Englishman recently commented upon the drabness of the American landscape, many of the loyal took issue with him. It was a sorry day for them, however, for his critical comment opened their eyes to the colorless houses that dot our suburbs and line our city streets. In all truth they could not but agree with him, whether they would or no, for the houses themselves bore out his contention.

Stereotyped color schemes for houses are either a habit or a curse. For some unknown reason, people are afraid to depart from the conventional green and white or gray and white. A charming Colonial house painted white with green trim is most attractive, but two dozen houses, Colonial and otherwise, painted white with green trim, are something of a bore. This holds true, too, for other conventional color schemes.

The house that attracts the most notice is the one whose color scheme is a little different. This illustrates how accustomed we are to commonplace color combinations. A variation, however slight, challenges attention. Unusual color schemes distinguish a house. They set it apart from the herd. They have, also, a dollar-and-cents value, as every real estate man knows. The house with an original color treatment usually sells quicker and at a higher price than one that is commonplace.

Not long ago some real estate promoters erected a number of houses on a suburban development. The houses were frame, built in symmetrical rows and painted the usual white, buff, green and red. Despite the excellent location of the development and the unusual transportation facilities, these houses were ignored by home hunters. As promoters cannot live entirely on air, they promptly forget about the development and it became a deserted community.

A while later a painter motored past. He looked over the houses, thought a few thoughts—and the next day made a proposition to the promoters. He offered to repaint the houses at his own expense, —in payment for which he was to receive a small percentage of the sales price. An individual color scheme was selected for each house, yet all the combinations blended in together. In a short time sales began and one by one "sold" signs were hung out on the little houses.

This incident is indicative of one thing —that people like, appreciate and prefer homes that have color distinction. The predominance of colorless houses, therefor, must be laid to the fact that most home owners feel themselves incapable of selecting original schemes and instead, play safe.

By "original" color schemes I do not mean freakish or gawdy. Triteness is in worse taste than striking color ever could be. With all the colors of the rainbow at one's disposal, to say nothing of the infinite number of shades and tints, it is really astounding how people escape using them and prefer to paint their houses as forty-nine others are painted!

A frame house may have all the color in the world. Instead of the all too common white and green treatment. why not use cream with old blue for shutters, trim and roof? Gray with yellow trim is another pleasant combination, as is brown and neutralized orange, or gray trimmed with deep, bright blue.

Here are some color suggestions for the body of a frame house,—coffee, fawn, apricot, gray green, gray blue, Italian pink or lavendar gray. For the trim there are dozens of gay, bright colors like apple green, robin's egg blue, terra cotta, yellow and cobalt blue. The roof may be of the same or a different color from the trim. Purple, blue, black and unusual reds and greens may be used to good effect.

In selecting colors, durability is an item not to be sniffed at. As a general rule, warm colors stand up better than cold colors. Tints based on reds, browns and blacks are most durable, so that grays, slates, browns and rich yellows set the record for paint longevity.

The shingled house offers a different problem, as well as a different medium. The soft, blurred outline of shingles is better adapted to warm pleasant colors than to the sharp, clear tones that are used so successfully upon clapboarding. The shingle is one of the most picturesque of building finishes because of its shape and texture, and its susceptibility to varied and beautiful color effects.

Shingle stains are made to suit the rough, textural surface of shingles. The colors sink into the surface and stain all the fibres with a depth that resembles the "pile" of rich colored velvet.

(Continued Next Week)

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

Indemnity Insurance Company of North America write practically every form of Insurance, except life

"ANTI-HYDRO" hardened concrete garage floors never wear out or need repairs

Water, oil, wear from chains and other severe conditions encountered in a garage, do not affect the concrete floors when they are hardened and waterproofed with "ANTI-HYDRO."

Because "ANTI-HYDRO" is so easy to use—simply mix it with the gauging water—and because it **permanently** hardens, waterproofs and oil proofs concrete all in **one operation**, you will find that its use is a real economy for both you and the owner. It saves more than its cost by eliminating repair bills.

For 22 years "ANTI-HYDRO" has been used by contractors the country over on every type of concrete hardening and waterproofing work. Age is the **real proof** of permanency. Use "ANTI-HYDRO" on your next job.

BUILDING PERMITS

Reports to the Department of Labor and Industry from twenty Pennsylvania cities and boroughs show the volume of building construction for August, 1926, to be more than a million dollars less than for the same month in 1925. The total estimated cost of construction for which building permits were granted in these twenty municipalities in August, 1926, was $18,640,409 and for August, 1925, the total was $19,673,880, representing a decrease in August, 1926, of 5.3 per cent. Comparing the eight months' total of building cost in 1926, for the twenty localities, with the total for the corresponding period in 1925 it is found that building operations in 1926 are nearly $45,000,000, or more than 26 per cent. lower than in 1925.

For the month of August, 1926, reports were received from 39 muncipalities in the State. These reports show that permits were granted for the construction or alteration of 4,283 buildings at an estimated cost of $20,626,373. Two thousand five hundred and eighteen of the permits were issued for the construction of new buildings. The cost for each new building averaged approximately $7,000. The average cost of additions, alterations

EXTERIOR COLOR

BY GERTRUDE WOODCOCK

(*Continued from last week*)

Some excellent colors are golden brown, maroon, wine, terra cotta or any shade of green. A shingled house usually has a shingled roof, which offers an opportunity for rich color combinations. Moss green roofs combine beautifully with walls of rich brown or silver gray, while red roofs look well with sage green walls, gray roofs with terra cotta walls and so on down the scale of olive greens, tans, browns, and thatch colors. There is even a special creamy white stain that is suitable for shingled houses built in colonial or Georgian style.

Shingle stains may be used on all types of unplaned lumber, such as is used on English half timber houses. Good colors for this are silver gray, which gives the effect of weathered timber, and rich browns,—although other shades are in good taste as well.

The trim of shingled houses may be as varied as that of frame houses. To carry out the tradition of shingles, however, warm, soft colors should be used.

Both brick and stucco houses may be painted—and to good advantage, for paint lends both protection and color variety to those sturdy materials. Ordinary brick houses can be given a sort of mottled sponge finish that gives the effect of variegated brick. A combination of light tan and dark red is pleasing, as

On the Ground When Wanted

AN ambition to give your orders the kind of attention that will THOROUGHLY satisfy you—has established us as a dependable source of supply for terra cotta.

Here are large stocks—and a REAL Service.

William H. Clausen

27th and Diamond Sts., Philadelphia

Columbia 6526-6527 Park 4981

is light red and dark red, orange and gray, or cream and dark gray. The method employed is to give the house a coat of paint, which, when dry, is covered with a coat of contrasting paint. Before this coat dries a sponge is rolled over the surface, lifting off some of the wet paint and allowing the ground color to show through.

Brick houses are often painted brick color,—an especially successful treatment if the trim is distinctive. Bright blue, green, blue-green, orange, black and even purple may be used in contrast with the rich brick color. Painting brick, like painting wood, is not entirely a matter of aesthetics, for, as paint protects wood from weathering and decay, it also protects brick from moisture.

Stuccó houses are best tinted warm, light shades,—soft pink, canary yellow, rich orange, terra cotta, cerulean blue. One of the most distinctive houses in an eastern suburb is of stucco tinted a soft Italian pink with trim of deep robin's egg blue and a roof of golden brown.

This is not all airy dictum, cooked up to please a few radical palates! The need for more color in American architecture is apparent on all sides. As in everything else, however, there are certain rules to be followed in planning exterior finishes. If these are followed rigidly and unstereotyped colors used, the results will be tasteful as well as distinguished.

Otherwise a brilliant or unusual color scheme, applied without regard to style, size or location of the house, is apt to look as though the painter has had a brainstorm and flung his paint pots about.

Since light colors have the effect of apparently enlarging a house and dark colors apparently decreasing it, the proportions of a house should be considered first. A large square house, for instance, set on a bare hillside or on a treeless plot, looks bare and harsh if painted white or one of the light colors. Its austerity is emphasized. A soft gray, fawn, coffee or green color would tone it down. If, however, the house is wellshaded with trees and surrounded by shrubbery, it may be painted a light color and darkened slightly with trim of heavier color. Neutral color treatments are always suitable for large houses. By "neutral" do not misunderstand "dull". A dark house need not look dismal or mud colored. It may be just as attractive—by virtue of its bright trim,—as a vivid little cottage.

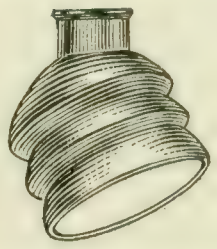
Since the small house can carry almost any color, there is but one rule to follow —don't paint it dark unless you wish to make it appear smaller than it is. The little house offers endless opportunity for original color treatment. As a matter of fact, any house that is well-surrounded by foliage may be painted brighter colors than one which stands alone and bare.

Next door neighbors must be considered, too. The color effect of the whole street is as important to each separate house as their individual color schemes. Try to make your house harmonize with those in the immediate vicinity. Don't use mustard color if the house to the right is green, or Italian pink if the house to the left is red. A good plan is to try to use some tone of the dominating colors of the neighbors' houses on your own. For example, if the house next door is white with trim and roof of apple green, and the house on the other side is fawn with trim of bright blue, what colors would look best on your house?

Cream would be excellent for the body, since it would not clash with the fawn tone of one house nor kill the white of the other. For trim I would suggest green-blue and, if the color urge is very strong, a roof of dull yellow with chimneys to match the trim. In this way the house would "bridge" the colors of the other two without losing its own personality.

The home owner's best color advisor is the architect, who designed the house with certain colors in mind, who knows what color treatment is appropriate to the style of the house, and, above all, what lines should be emphasized to make it appear at its best.

Exterior decoration is important, not only from the standpoint of preserving the house, but also because appearances count. No doubt many a warm heart has beaten beneath a shabby jacket, but when it comes to houses, one doubts as much if thrift and dependability are found in the down-at-the-heels-house as whether taste and discrimination can be sheltered by walls and decorated in commonplace, trite style.—*Keith's Magazine.*



The selection of the right type of waterproofing material and the right firm to apply it is a matter of paramount importance to the construction company or to the building owner.

A man whose work in this field has made many friends because of his thoroughness is J. F. Dakin, trading as the Philadelphia Building Materials Co. Any kind of waterproofing and dampproofing work is within the province of this concern. His experts are always ready to advise just the right material to use and skilled workmen are ready to apply it. Whether the job is finishing a roof or making a foundation water tight, it is all the same, and, regardless of whether the job is large or small, attention is given that will insure satisfaction.

A few of the buildings completed by the Philadelphia Building Materials Co. are the Byberry Hospital Building, Sam Schubert Theatre, Kingsessing Library, York Lynn Apartments, Elizabeth Manor Apartments, Oxford Bank, Internes' Building, Power House and Tunnel and a new group of eight buildings of the Philadelphia General Hospital, The Philadelphia Public Library, Crum Creek Memorial Bridge of Delaware County, Inquirer Building, Walnut Hill Apartments.

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

274,000 PRIVATE GARAGES TO BE BUILT DURING 1926

The private garage, asserting itself in the construction of almost every new home built, presents a problem with most interesting angles. There is the architectural problem, the appearance, utility and cost, and there is the fire hazard.

Granting that the prospective home owner owns a machine, the proper housing of that machine becomes a problem for architect and builder. How great that problem is can be judged from the fact that statisticians estimate that this year will see the construction of 274,000 private garages. If those garages only average in cost one hundred dollars each, the total amount to be invested in automobile housing would amount to approximately twenty-seven and a half million dollars. As a matter of fact, we can probably safely say that more than sixty million dollars will be spent this year on private garages. The question then very naturally arises, "How can this immense sum be spent to the best advantages?"

Why the Attached Garage

We are an ease loving people. The chilly journey across the yard to a cold garage, does not appeal to us on a winter's morning. We object to a dash into the rain storm, fumbling with a garage lock. Then heating a detached garage is a problem.

For a detached garage, a separate heating plant is almost a necessity to keep the car in proper working order and to prevent its paint from checking. If any machine can make a more pitiful plea for help than a self starter in an unheated garage on a zero morning, it is unknown to us! Any experienced driver will tell you that you are laying up trouble for yourself when operating an automobile under these conditions.

But there is also an aesthetic side to the rapidly shifting position of the garage. No matter how well the detached garage may be designed, it detracts from the appearance of the backyard. When planning a garden, this building and the driveway to it always constitute a problem. If placed near the house or made a part of the house, the entire rear of the lot is left free to plant with trees, shrubs and flowers.

The Evolution of the Garage

Originally the garage was a separate unit, much as the stable used to be. Unfortunately, however, as automobiles became more numerous a tendency arose to house them in a type of overgrown woodshed. The old stable was usually designed in harmony with the house but the portable garages and the sheds for automobiles began to arise in every locality.

A more recent development has been the semi-detached garage. The result is most happy for the neighbors.

Today, the great trend is toward the attached garage and this is worthy of particular study both in its relation to architecture and fire safety.

Method of Handling the Attached Garage

Attached garages may be grouped in three distinct classes.

1. A building which is similar in most respects to the separate garage, but which is placed against the house.

2. An attached garage which is actually designed into and made a part of the house.

3. Basement garages.

In the case of the attached garage which is placed against the house, the problem is a comparatively simple one, as far as design and construction is concerned. Usually the garage becomes a wing jutting out from the rear of the house and merely separated from it by a wall of high fire resistive quality. Many codes require that this wall be carried up as a parapet, 18 inches above the roof of the garage.

Often, however, this type of garage is placed on a wing at the side of a home and forming part of the architectural treatment of that home. This method has several advantages. It makes the house seem much larger than it actually is and eliminates the driveway from that portion of the lot behind the house.

In many instances, however, our modern, narrow city and suburban lots will not allow this type of treatment particularly if a two or three car garage is desired.

Of particular interest to the builder and home owner is the fact that through this means, the garage may be attached to the house, with all the advantages that entail, at very little if any extra cost over the separate garage of like construction and architectural detail.

Make It Part of the House

It was only natural, however, when the above type of garage was planned, that the architect or owner would realize that it presented an opportunity to obtain extra second story floor space at a low cost per square foot. It would be unnecessary to dig a basement under this portion of the house and the cost of running the walls up to the second floor would be included in the cost of the garage. Hence, today, we find in even modest homes, the garage being built into the house with sleeping rooms above the garage and easily accessible from the house.

Examples of this type of construction appear everywhere and it is becoming most popular.

The Basement Garage

In many localities in which there is a heavy slope to the lot, or the house is built at a level considerably above the street grade, the garage is placed in the basement. Under the terrain conditions outlined above, this is most logical as it gives all the convenience of the attached garage and at the same time makes use of basement space which is often wasted in homes.

Fireproofing the Attached Garage

Fireproofing an attached garage is necessary, naturally. The National Board of Fire Underwriters have furnished a Code of Suggested Ordinances for Small Muncipalities. The recommendations of such an authority are as nearly final as one may find.

Cost

The cost of an attached garage is no more, if as much as, the cost of a garage of equally good construction detached from the house. Insurance is not increased, unless living quarters are over the garage. The increase even in that case is only nominal and is well worth it when the convenience and beauty of the attached garage are considered.—*Metal Lath News.*

CODE

Suggested by National Board of Fire Underwriters

Section 4. A private garage may be located beneath or attached to a dwelling, provided the following regulations as to its construction are rigidly complied with:

(a) The floor and ceiling construction above the garage when it is located beneath the building, or the roof when the garage is attached to the building, shall be unpierced and shall have a fire-resistance of one hour based upon the Standard Specifications for Fire Tests of Materials and Construction.

(b) Walls and partitions shall be of such construction as will meet requirements of the one-hour test as above specified.

Note—a minimum type of floor and ceiling construction which it is believed will meet the requirements of the specified test would be constructed as follows:

Two-inch floor joists spaced on not more than 16-inch centers and properly bridged. Overhead flooring double of 7/8-inch rough and finished floor boards with a layer of asbestos or other non-flammable floor felt between. Ceiling of heavy metal lath and Portland cement or gypsum plaster not less than 3/4 inch thick, the metal lath to be attached to the joists by 6 penny nails driven nearly home and heads turned over against the lath, the lath to be bent down 6 inches along the walls on all sides and securely attached to same. Expanded metal lath should weigh not less than 3.0 lbs. per sq. yd.

"ANTI-HYDRO" hardened concrete garage floors never wear out or need repairs

Water, oil, wear from chains and other severe conditions encountered in a garage, do not affect the concrete floors when they are hardened and waterproofed with "ANTI-HYDRO."

Because "ANTI-HYDRO" is so easy to use—simply mix it with the gauging water—and because it **permanently** hardens, waterproofs and oil proofs concrete all in **one operation**, you will find that its use is a real economy for both you and the owner. It saves more than its cost by eliminating repair bills.

For 22 years "ANTI-HYDRO" has been used by contractors the country over on every type of concrete hardening and waterproofing work. Age is the **real proof** of permanency. Use "ANTI-HYDRO" on your next job.

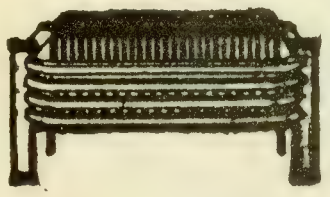
WHAT IS A FIRE INSURANCE AGENT?

What your agent is to you depends largely upon what you give him opportunity to be.

He may be only an executor of the usual commissions falling to the insurance agent—



Or, he may be your insurance advisor, pointing out how unnecessary hazards may be eliminated, and how the fullest protection is to be secured for the least money.

He prefers to act in the latter capacity, and there is no added cost to you for such service.

As The Editor Sees It

The wisdom of using standard or trade marked nationally advertising building materials and equipment will be impressed in a dramatic way on the public mind during the next twelve months in the most remarkable merchandising campaign ever, organized in the building materials field.

Under the supervision of the Home Owners' Service Institute of New York City, 360 model demonstration homes will be built in the next year in 28 "key" cities of the United States in an effort to convince prospective home owners of the ultimate low cost of good grade materials compared to the cost of poor or substitute materials. The Home Owners' Service Institute is an organization pledged to raise construction standards in this country and the model house campaign is a feature of its 1926-1927 program. Such non-competitive organizations as the Lehigh Portland Cement Company, the Long-Bell Lumber Company, the Common Brick Manufacturers Association of America, and the National Fireproofing Company are members of the Institute, who believe that their sales will increase from coast to coast as a result of the educational features of this campaign.

This organization has taken the old fashioned and well known "model" house that has appeared from time to time for many years back in various department stores, subdivisions and public squares and dramatized it through the application of modern merchandising methods so business will be actually stimulated from coast to coast for the various members of the Institute and the entire building trade. A series of unusual and charming architectural designs, approved by the American Institute of Architects, have been selected for these demonstration houses that are being built of brick, stucco, frame and combinations of these materials.

A number of these houses will be opened this month (October) and others on into November and December. The cities include New York, Cleveland, Atlanta, New Orleans, Chicago, Denver, San Francisco and twenty-one other cities.

These houses will be built under architectural supervision, by Realtor-Builders, members of local real estate boards in good standing in each city and they will be built from specifications laid down by the Home Owners' Service Institute which read like a Blue Book of the building materials field. Each Realtor-Builder will construct ten houses according to these specifications; one of these houses will be the official demonstration home and will be furnished, decorated, landscaped and opened to the public for a period of four weeks. In cities like Chicago and New York, there will be from two to three Realtor-Builders included in the program, each building ten homes of nationally advertised materials, reaching a total of 360 houses in the 28 carefully located centers.

From here on, this campaign differs from any other model house demonstration ever before attempted. Back of the building of these houses is an elaborate organization covering the advertising and news columns of the dominant newspapers and trade journals, national magazines and outstanding trade journals of the country. Pages of educational advertising and publicity in these mediums will be supplemented in each city by the distribution of millions of "Manuals," setting forth the fundamental principals of good construction and the wisdom of pieces of literature calling attention to the demonstration houses and hundreds of store window displays, all urging the public to demand good construction. Three

Many of our students have paid one of the above amounts—given up two or three nights a week for seven months—and—increased their pay fifty to one hundred per cent.

YOU CAN DO IT TOO!

WANAMAKER INSTITUTE

Twenty-third and Walnut Streets

Write or telephone Locust 31-49 for Catalogue of all Courses

million dollars will be spent in this effort in advertising of various kinds and $5,000,000 will be spent in read estate, construction labor and good grade or standard materials and equipment, a total expenditure of $8,000,000 for better building publicity. More than $100,000 is being spent in national advertising alone.

Here is a dramatization of the model house that makes it different from the oft repeated attempts to sell real estate, furnishings or builders' services by opening a finished home to the public gaze. Long before the opening of those houses, the public in each Center will be urged on all sides to consider the construction of their homes, to make sure that good grade or standard materials are being properly used by reputable contractors. The bombardment will continue after the house is open in each center, through the sponsoring newspapers and through the co-operation of public utilities that will mail out educational literature in hundreds of thousands of monthly statements, and through the efforts of the individual members of the Home Owners' Service Institute though thei local leaders.

It is the careful tie-up of this campaign with every available medium of reaching the public attention that will impress these houses so vividly on the public mind that construction standards will be established throughout the land that other builders will find it wise to follow.

274,000 PRIVATE GARAGES TO BE BUILT DURING 1926

(Continued from last week)

For walls and partitions any construction meeting the test qualifications should be approved. In absence of test records proving that less thickness of material may be employed the following may be accepted: Brick, hollow tile, concrete block or gypsum block, 4 inches thick, or reinforced conrete 3 inches thick. The foregoing incombustible constructions are recommended.

The minimum construction meeting the requirements for walls would be a back-plastered Portland cement stucco on heavy metal lath attached to wooden studs spaced on 16-inch centers with metal lath and ¾-inch Portland cement or gypsum plaster on the inside surface. For partitions, ¾-inch Portland cement or gypsum plaster on metal lath on each side of stud construction as above specified may be accepted as fulfilling the requirement.

(c) All doors and windows with their sash and frames shall be of standard fireproof construction and glazed with wired glass.

(d) Openings from dwellings into garage shall be restricted to a single doorway; such openings shall be protected by a standard swinging self-closing fire-door with approved fire-resistance frame and hardware. No glass shall be permitted in such door.

(e) When doorway connects directly with a cellar or basement on the same or lower level in which there is any heating device or gas fixture, it shall have a sill raised at least one foot above the garage floor level; or the doorway shall lead into a vestibule from which a second door connects with the cellar or basement.

(f) Garage floor shall be of concrete or equal fire-resistive and impervious material and shall have a slope sufficient

THE ROYAL CHAPEL — DUBLIN, IRELAND.

WORLD FAMOUS STRUCTURES

THE Royal Chapel, Dublin, Ireland, and the Record Tower constitute the most striking feature of Dublin Castle. Although small and extremely simple in plan, it is built in an exceptionally rich style of Gothic Architecture.

This structure is on the site of an old Sixteenth Century Garrison chapel. The foundations for the present chapel were laid in 1807 and the building completed in 1814. It was built by the Duke of Bedford, entirely of limestone, and the chapel and tower are the only remaining portions of Dublin Castle.

(*Continued from page* 632)

to permit natural drainage of gases, oil and water to the outside.

(g) Separate means of exit from all dwelling quarters in such buildings shall be provided; such exits shall be separated from the garage section by a partition having a fire resistance of one hour based upon the Standard Specifications of Fire Tests of Materials and Construction. The Building Official shall also have the power to require the construction and maintenance of outside stairways or fire escapes wherever he shall deem the same essential for safe exit in case of fire.

(h) There shall be no stove or forge in any private garage except in a heating room thereof, which heating room shall be separated from every other part of the garage by partitions having one hour fire resistance fitted tightly to floor and ceiling. There shall be but one door to such heating room, which door, unless opening from the exterior, shall be self-closing standard fire door closing against a sill not less than 12 inches above the floor at the foot of the door.

* * *

We draw your particular attention to articles a and b of this approved ordinance. Undoubtedly the least expensive method of complying with the code is to use metal lath and ¾-inch of plaster on the under side ceiling joists and the same on both sides of 2x4 inch studding in the walls. This construction has received the full one hour fire rating which is demanded by the proposed ordinance. Also note that backplaster stucco on metal lath affords minimum cost construction for exterior walls.—*Metal Lath News.*

HOW TO ADD YEARS TO OAK FLOOR SATISFACTION

By the E. L. Bruce Co., Memphis, Tenn.

In the larger cities, floor laying companies have developed methods and have adopted formulae for the laying and finishing which have proven highly satisfactory. In many cases these methods differ, due to local conditions or methods of application.

It is the purpose of this article, therefore, to put information in the hands of the man who is not thoroughly familiar with all of the essentials of oak floor laying. We do not discount methods that floor layers in the larger communities have adopted after years of experience, but offer these suggestions for the man who has not had that experience, and who is looking for information.

Not only in clubhouses, hotels, apartments and other public buildings, but in private homes as well, no woodwork stands out more prominently nor is capable of giving so much satisfaction to the owner as well-laid and finished oak floors.

The floor layer who gives attention to the following points can do much toward securing a well-laid and finished oak floor, and at the same time eliminate all possibilities of trouble and dissatisfaction on the part of the owner.

The Subfloor Must Be of Thoroughly Dry Material

If the subfloor under an oak floor is of green lumber, or if it has absorbed dampness in any way, this dampness will be absorbed by the oak flooring that is laid over it. This will tend to make the oak floor buckle or cup.

The Subfloor Should Be Reasonably Sound and Level

The subfloor should be so sound that the nails will hold well If the oak flooring is to lay easily and make a quiet floor with a minimum of scraping, the subfloor should be level. It is not a difficult matter to plane down all uneven places in a subfloor, and when done, the oak flooring can be laid with much greater speed.

The subfloor should be gone over carefully and renailed where necessary to make it firm. Loose, sqeaky subfloors are often the cause of squeaky oak floors.

Oak Flooring Should Not Go Into Buildings Until Plaster is Dry

Due to its tendency to absorb moisture, oak flooring should not be placed in a damp building either for storage purposes or prior to laying. Wait until the plaster is thoroughly dry, and the wiring and plumbing mechanics have left the building.

An Insulator Between Subfloor and the Oak Floor

A substantial rag felt paper thoroughly saturated with genuine asphalt is the best insulator. This asphalted felt, or a heavy tarred felt (not less than 20 pounds) does much to protect the oak flooring from dampness entering through the back.

While there is still a possibility for the oak flooring to absorb dampness through the top if the finish is not carefully applied and kept up in good condition, it is a good plan to use this asphalted or tarred felt. In addition to its ability to withstand moisture penetration to a considerable extent, it is also effective as an insulator against cold, acts as a sound deadener as well as a cushion for the oak floor. This paper in addition retards termites (insects that sometimes bore into and seriously damage interior woodwork).

Nails—An Important Factor

Well manufactured oak flooring need not be pounded together, provided the nails do not split the tongue and are properly driven. The proper selection of nails is therefore an important factor. We recommend the following:

For 13/16-inch oak flooring use 7d cut flooring nail or 8d bright casing nail, spaced 12 to 16 inches apart.

For ½-inch oak flooring use a 5d finishing nail about 8 to 10 inches apart.

For ⅜-inch oak flooring use a 4d finishing nail, spaced about 6 inches apart.

Nails should be slanted so the point of the nail when driven through the tongue penetrates the back of the flooring at the first edge of the recess. This will hold the flooring firmly and pull the edges snug. Strips should not be driven up excessively tight.

The appearance and condition of an oak floor before and after finishing de-

pend largely on the method and skill of mechanics responsible for the fitting and nailing.

Laying Out the Floor

Many floor layers find it helpful to lay out the floor before commencing to nail it. In this way they have an opportunity to match the color of adjoining boards more closely and to take care of the varied lengths.

Finishing Oak Floors

On some jobs the floors are scraped and sanded by the floor layer and the finishing done by a painter. On other jobs the floor layer does both the sanding and the finishing. Here again, we do not want to discount finishing methods adopted by those familiar with the work, so the following suggestions are general and will prove satisfactory under average conditions.

An oak floor should be finished as soon as possible after laying. The first step is that of scraping which can be done either by hand scrapers or by machines. In the case of hand scrapers always work with the grain of the wood.

After the scraping is completed the floor should be gone over with a fine standpaper. In case there are spots on the floor that have been caused by dropping oil or other matter you can best clean them by rubbing with steel wool dipped in turpentine. DO NOT WASH A NEW FLOOR WITH WATER, AS THIS RAISES THE GRAIN and will not get out the spots as will the other method.

After the floor has been carefully sanded, wipe up all dust with a soft cloth. A PASTE filler should be used on oak as it is an open pore wood and this filler penetrates the pores and makes an ideal base for shellac, wax or varnish finish.

Paste filler should be applied with a clean rag or waste. Before it is thoroughly dry wipe all excess filler off, either with burlap, excelsior or waste. This should be wiped off ACROSS THE GRAIN so as to remove as little of the filler from the grain of the wood as possible. When the filler is dry, sand the floor thoroughly with 0 sandpaper, and after the dust is cleaned up with a sott cloth the floor is ready for either the shellac, wax or varnish finish.

Finishing Materials

Many people think that all that is needed for successful work is fine material for the last coat. No greater mistake can be made. No matter how good the final finish may be, the undercoatings must be equally as good to get the best final appearance.

The slight variation in price between good and poor materials, whether shellac, wax or varnish, should not stop the floor layer from using the very best obtainable in his locality.

Shellac As a Floor Finish

The use of shellac for finishing flooring has been widespread because it is cheaper than varnish. Shellac enables one to have a floor finished cheaply without sacrificing beauty. Shellac, however, does not have the durability possessed by other finishing materials, and it is usually considered best to apply a coat or two of wax over it to protect it from deterioration from the action of the air and moisture in the atmosphere.

In many cases shellac is favored because it dries so quickly. A second coat can be applied soon after the first coat has been sanded after drying and the floor is ready for use in a comparatively short time.

If Wax Is to Be Used for Finishing

The wax finish for oak flooring is preferred by many, due to economy not only in the first coat, but in the ease and economy in renewing places that show wear. The renewing may be easily taken care of by the housekeeper or a servant. Wax, like the good grades of varnish, is absolutely transparent and does not hide the grain. It gives a lustre to the floor that is desirable to many home owners. Wax does not become brittle, nor does it scratch or mar as easily as some finishes.

In using wax as the finishing material it is not necessary to use either shellac or varnish under it. Wax makes an ideal floor finish when applied directly over paste filler.

A good method for applying floor wax is to place a small quantity of wax between two or three thicknesses of cheese cloth, forming a sort of bag. The wax will work through the meshes of the cloth as it passes over the floor, thus insuring a thinner, more even coat than if you put the wax on the outside of a cloth and apply it direct. Allow about fifteen minutes for this coat of wax to dry, then rub to a polish with a weighted floor brush or an electric polishing machine.

In an hour or two a second coat of wax should be applied the same as the first. This second coat is not absolutely necessary, but it will give a more durable, wear-resisting finish.

The Varnish Method of Finishing Oak Floors

For the best results three coats of good varnish should be used, although two coats will be found very satisfactory. It is important to start out with a clean brush, using a large bristle brush, either oval or flat.

Each coat should be allowed to become thoroughly hard during a period of twelve to twenty-four hours and should then be sanded lightly with 00 sandpaper and the dust thoroughly cleaned up before the next coat. Under favorable conditions twenty-four to forty-eight hours should pass between sandpapering and the application of the next coat.

The final coal may be left in the natural gloss or may be brought to a dull finish by rubbing with pumice stone and oil three or four days after the last coat has been applied.

The varnish finish is usually more expensive than the wax or shellac finishes, but it gives a very hard surface, which at the same time is durable and elastic.

Don'ts for Varnishing

Do not varnish over dusty, greasy, damp or injured surfaces.

Do not undertake fine work with dirty varnish pots, dirty brushes or dirty cloths.

Never wet the brush with oil or turpentine while applying varnish.

Do not shake the can before using. It causes numerous bubbles.

Do not pour unusued varnish back into the can. Reserve it for less particular work.

Do not mix two different varnishes together, as you change their nature entirely, and produce a new varnish that should be aged before using.

Never apply a second coat of varnish before the first one has dried hard. Cracking is often due to failure to observe this rule.

Do not try to spread varnish that has become chilled. Likewise the room should be warm when the varnish is applied.

Floor Oil Finish

In some classes of buildings, such as warehouses, office buildings, factories, schools, and other public buildings, a high class finish is not always desired. The floor oil finish is an economical one and light flooring oil is used. The oil is made expressly for the purpose by many paint and varnish manufacturers, and one of its advantages, which incidentally makes it a low cost finish is that this oil acts as filler as well as finish.

—*The Associated Contractor.*

Don't be discouraged if you make an occasional mistake; if men didn't there wouldn't need to be any claw on a hammer.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Dependable Property Protection

The value of your insurance protection lies in the strength and service of the organization back of it.

A NORTH AMERICA policy stands for financial stability and prompt settlement with a minimum of trouble and delay.

Your agent can get you a North America policy.

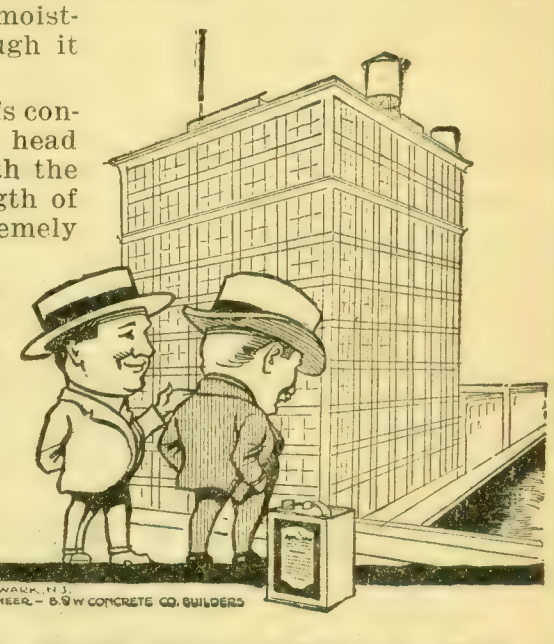
Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

"ANTI-HYDRO" Keeps a Canal Out of this Building



The concrete basement wall is also the canal wall. Water flows continually against the outside, but the inside of the wall is dry as a bone.

This concrete wall was waterproofed with "ANTI-HYDRO" thirteen years ago. Not a drop of moisture has ever penetrated through it during all these years.

"ANTI-HYDRO" waterproofs concrete *permanently* against any head of water. It also increases both the tensile and compressive strength of concrete and makes it extremely hard, all in *one operation.*

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. It mixes readily with the gauging water without the aid of skilled labor.

For 22 years "ANTI-HYDRO" has been the accepted standard. Be sure to use it on your next job.

WHAT IS A FIRE INSURANCE AGENT?

What your agent is to you depends largely upon what you give him opportunity to be.

He may be only an executor of the usual commissions falling to the insurance agent—

Or, he may be your insurance advisor, pointing out how unnecessary hazards may be eliminated, and how the fullest protection is to be secured for the least money.

He prefers to act in the latter capacity, and there is no added cost to you for such service.

As The Editor Sees It

WHY A GENERAL CONTRACTOR?

BY HARRY CARLETON

Way back in the reign of Caesar Augustus, a learned gentleman by the name of Vitruvius was the Imperial Architect, and he addressed a series of articles or essays to his Royal Employer. These articles are called Vitruvius' "Ten Books of Architecture," and offer some interesting reading.

In those days, it seems the architect was the General Contractor as well as the designer, and, apparently, under the law, no architect was permitted to start a job unless his personal estate was equal in value to the estimated cost of the work. In case the job overran the estimate, the Architect had to make good the difference himself, and his reputation suffered severely. A plan such as this, effective today, would certainly make bidding much less of a hit or miss proposition, and would eliminate many architects and contractors from a lot of work. We moderns handle the same idea in a slightly different way. We bond our contractors to insure the completion of the work—but the owner pays for the bond. He may not realize that he's paying for it, but it's in the bid somewhere, and the bonding company runs the risk.

Building wasn't such a complicated affair then as it is now. It was more massive, and to some extent more enduring. That last statement is made advisedly, for our modern steel-concrete buildings haven't been in use long enough for us to determine their length of life, while many Roman buildings are still standing. But when Vitruvius was practising his art, building was of necessity massive. Structural steel was unknown, and each unit had to carry not only its own weight but also had to support other units, hence the great thickness of walls. Plumbing, electric wiring, woodwork, floor-scraping and a lot of other trades were unknown, or at least little in use in Vitruvius' day. Masonry, plastering and painting or decoration were his chief trades. What plumbing was done was done by masons.

But in spite of the fact that building was a much less complicated affair, no building project of any importance was undertaken without the services of the architect, and to use a modern aphorism, the Augustan architect had to "know his oil!" Consider, then, the temerity, the nerve, and the boldness of Mr. Modern Man who scorns not only the services of architect, but also disdains to employ a General Contractor, and blithely sets sail to build him a house in which no less than seventeen different trades play a part! We gasp at dare-devil feats of acrobats, racing drivers, aeronauts; we thrill at the chances taken by some financial wizards, but the fellow who starts to build a house by direct labor doesn't raise a ripple. Yet he's a lot more foolhardy than these professional hair-raisers who are trained to do their stunts, and who figure to the fractional part of an inch before they tackle their stunts. They risk nothing in many of these stunts—the laws of gravity and momentum governing their acts, but the man who builds by direct labor takes all kinds of chances.

And the reason these men try to build by direct labor is to save money! They tackle a large investment and try to put it over by themselves, urged on, after having seen a clever General Contractor skillfully and speedily put up buildings, by thinking they can do the same things themselves. Nearly every man who tries this stunt is steadily employed and has only his after-working hours to devote to the job of building. Try to get one of these fellows to invest several thousand dollars into a part-time proposition, and they'll tell you how crazy you are,

but they'll cheerfully gamble thousands in buiding a house on their own part-time and vast ignorance.

Yet not one of these men tries to buy cloth, linings, buttons, etc., and hire a bushelman to build him a suit. Not one of them buys a motor, frame, wheels, fenders, etc., and hires a mechanic to assemble them into an automobile. Not one of them would put his savings into an institution where the man who handled the affairs of the bank devoted only after-working hours and Saturday afternoons to the banking business. But they tackle the job of building, and it is to the everlasting credit of builders supply men and others that the owner doesn't get stuck worse than he does.

Now I do not mean that building is a fearsome and awesome job. It isn't—to the trained man of experience, but it is apt to be a Gargantuan task to the one who hasn't the knowledge. Knowledge and experience are what you buy when you let your home building job to a general contractor. It is just as foolish to try to save money by dispensing with the services of Architect and General Contractor as it is to try to save money by being your own lawyer, doctor or dentist.

I do not mean to decry the practice of doing without a General Contractor when an Architect is retained. Many Architects prefer to deal with the various trades direct, and in such cases the owner runs no risk, for the Architect is also a trained man of knowledge and experience.

But—the majority of homes are erected without the services of an Architect, and in such cases the General Contractor has a definite and useful place. What does he do to earn his fees?

First let us assume that your General Contractor is a man worthy of his title. He is a business man, is intelligent, honest, trustworthy, and has experience—the same qualities that make you have confidence in your favorite department store. As a business man your contractor is in touch with the market for labor and material. He knows a good workman when he sees him; he knows good material when he sees it; he knows where to get good labor and good material. His experience has taught him that certain firms do not stand back of their products the way others do; he knows what constitutes a day's work for tradesmen. He places all this knowledge and experience at your disposal and serves you as loyally and efficiently as any good business man serves his customers. He knows the value of good will; he knows that the best advertising he can get is your word of mouth commendation to others, and he works faithfully to earn your confidence.

It is his experience in building that saves you dollars. He knows how to get satisfactory results without needless waste. He knows the rotation in which the trades should work to achieve the best results. He knows the building codes, and he works to give you the satisfactory job you require. He works not only during the day, but also at night. Each day he checks up on what he planned the night before, and half his evening is spent in your service. Regular hours know him not, but the Midnight Oil and he are well acquainted in order that everything may progress on schedule.

Yet some misguided ones think they can "beat the game" by dispensing with the hard-working General Contractor's services. They think they can come into the open market and beat the man whose business it is to know the market.

That's why Wall Street keeps going. There are always men who are sure they can "beat the game." There are always lambs to be shorn by Wall Street.

Hughes-Foulkrod Company, Builders, formerly of Commonwealth Building, Philadelphia, have moved their executive offices and accounting department to 817 Schaff Building, Fifteenth and Race Streets, Philadelphia.

Construction operations staged a "come-back" in September, after having shown a freakish decline in volume during August. A steady increase last month brought the total amount of work for the month up to a level with the highest point reached in any month during the record-breaking year of 1925, according to statistics compiled by the Associated General Contractors of America.

As a result of the speeding up of operations during September, the amount of building carried on during the first nine months of this year reached a volume 3 per cent. greater than the total recorded for the corresponding period of 1925. This fact is being held as especially significant because all previous records for construction activities in the United States were broken last year.

The September volume is registered at the index number 221 on a scale which has as its basis the average for 1913. This indicates a gain of six points over the August figure.

Volume of Construction

Iron Work That Stands Inspection

BUILDERS' Iron, Stairs, Railings, Etc. Wrought Iron Gates and Fencing, Pipe Work of all Kinds—Bent and Plain, Forgings and Special Iron Work.

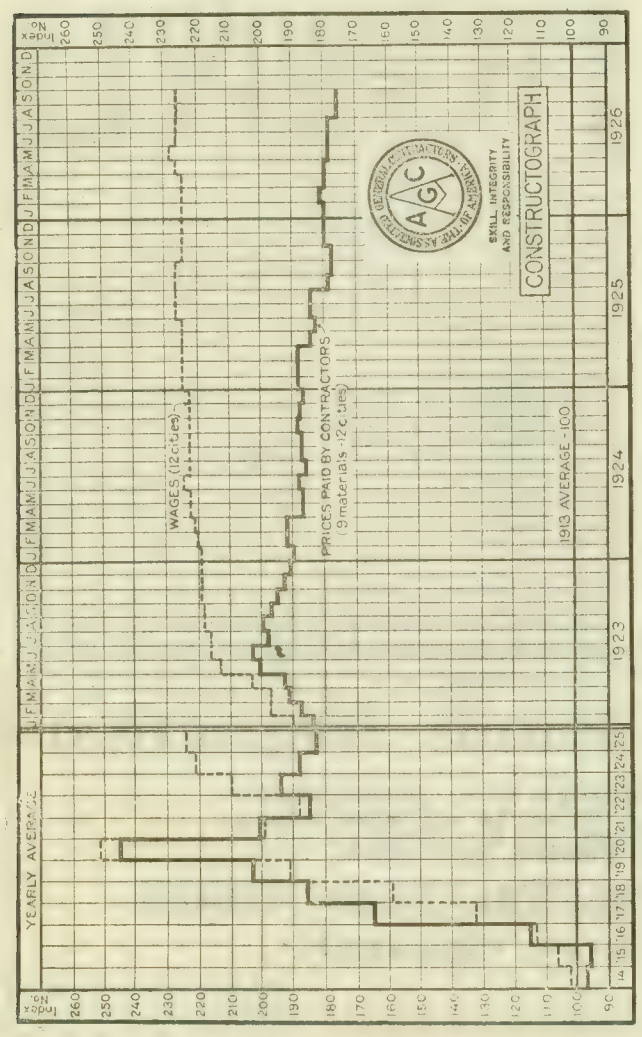
FRANK PETTIT ORNAMENTAL IRON WORKS

1505-15 N. Mascher Street, Philadelphia

REGENT 9857 PARK 4147-4148

In only one other month on record has a greater amount of work been handled. That was in July of this year, when operations spurted to set a mark of 228.

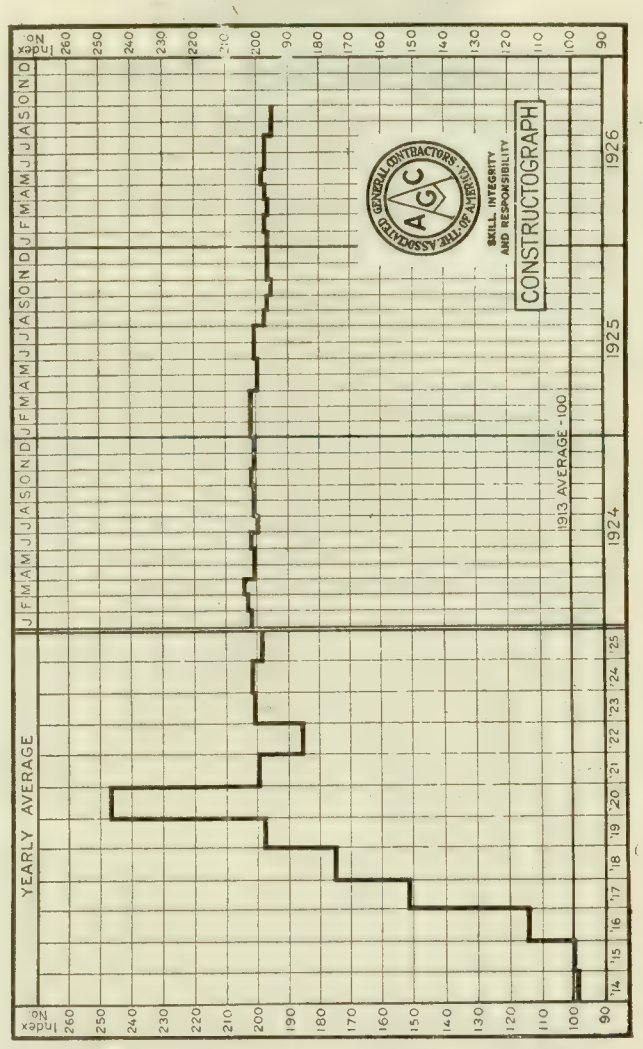
The ability of operations this year to hold their own with the vast amount of activities that featured 1925 is traceable mainly to the abnormal spurt in July and to the comparatively small reactive drop that followed. As matters stand, the heavy decline which some students of the situation felt might materialize following the high peak reached in mid-summer has failed to put in its appearance.



Construction costs are showing little inclination to change. During September they remained on the level they held throughout the previous month, according to statistics compiled by the Associated General Contractors of America. By maintaining this position, they continued for the second month to be on the lowest plane registered since March, 1923.

There has been only one change in the level of costs since June, and that occurred when reductions in prices of materials purchased by contractors caused the August figures to show a small decline from the July position.

During September no change was noted in either the wages paid in the construction trades throughout the country as a whole nor in the prices of building materials.



In only one month during the past five years have the average prices for building materials paid by general contractors been lower than they were last month.

Wages and Material Prices

Wages in the building trades held fast to the level which they assumed in June after dropping slightly from the May figure, which was the highest recorded for any month during the past five years.

The September index number for construction costs in general, based on the 1913 average, was 196. The corresponding index number for average prices of materials was 176, while the figure for wages for 226. Thus the total costs are shown to be following a line virtually mid-way between the trend of wages and the trend of material prices. This has been the tendency since early in 1923.

The Fifth Annual Convention of the American Construction Council, Franklin D. Roosevelt, President, will be held at the Hotel Cleveland, Cleveland, Ohio, on November 8th, 9th and 10th, Dwight L. Hoopingarner, the Council's executive, announced recently.

Under the auspices of the Council at this time will be a series of conferences dealing with the fundamental relations of the construction industry to the public on such vital subjects as the permanency of building construction in relation to hazards of life and investment; public and private plans for housing financing; methods of certifying building materials; good workmanship; and town and city planning and city building in relation to city growth, city values and community standards. These and other topics having to do with the general problem of better building, a subject which the American Construction Council has been bringing vigorously to the attention of the American public nationally for several years, will constitute the key-note of these conferences.

Other topics of national importance, as for example those having to do with practical methods of reducing construction peaks and depressions not only in relation to the construction industry itself but also their effects and counter effects upon transportation and the allied producing industries of the nation as well as the consuming public, will receive attention.

Speakers of national prominence will address the gatherings which will be conducted as a common conference table or forum open to the public.

The Council's officers are: President, Franklin D. Roosevelt; Vice President, Harry A. Wheeler, Pres., Union Trust Co., of Chicago; George A. Harwood, Vice-Pres., N. Y. Central Railroad, and D. Knickerbacker Boyd, Architect; Treasurer, Wright D. Goss, Chairman, Empire Brick and Supply Co.; Dwight L. Hoopingarner, Executive.

ANALYSIS OF COST RECORDS IN CONSTRUCTION

Neglecting to Analyse the Plans and Specifications Carefully Has Caused Many Contractors and Builders to Sell

By E. W. ROBINSON, *Civil Engineer, McKenzie Construction Company, San Antonio, Texas**

It is only within recent generations that the matter of cost in regard to the construction of public and private buildings has been given much consideration. In ancient and medieval times when it was decided to erect a pyramid, an aqueduct or a cathedral, a man or a group of men who were competent in this work were secured and given charge. The engineer or architect was also the constructor, and while they usually built well, so far as serving the purpose for which the structure was intended, it is interesting to note that the only records of cost that history gives us show that it took so many thousands of men so many hundreds of years to accomplish their object.

The same conditions prevail in modern times during periods of war or great disaster. During the late war we witnessed large and important projects put through with no idea of money cost prevailing; and in matters of life or death, either personal or national, it is right and proper that cost should not be a determining factor.

It was not so many years ago that engineering was defined as "the art of

---

*A paper read before a meeting of the Texas Section of the American Society of Civil Engineers at Houston, and published in the minutes of that meeting.

directing the great sources of power in nature for the use and convenience of man." Since the promulgation of this generally accepted definition of engineering, the idea of economy or conservation of the resources of Nature, has entered into the activities of our complex civilization, and now the idea of cost of any proposed project is second only to utility of design.

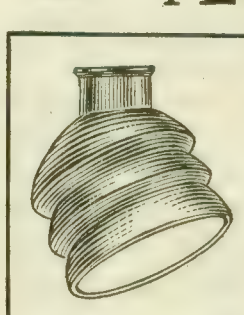
On all projects financed by private capital the cost must be kept down to such a point that the estimated returns from the use of the structure will at least pay interest on the amount of money expended. On public work and where aesthetics play an important part, the matter of cost is of paramount importance, even though the dividends or returns on the investment are not considered.

The engineer should be familiar with the economical features of construction in his particular line; in fact he must be to succeed in every sense of the word. In the first place he must estimate the cost of a proposed piece of work, and from his estimate of cost the necessary funds to pay for the construction must be secured by the owner, either through bond or stock issues, or otherwise. Then the project must be designed so it will serve its intended purpose and yet be built for the amount of money provided.

The term "cost" as applied to itself is relative and when taken without reference to the context conveys little meaning. For instance, the sum of $10 may be the cost of a pair of shoes to the buyer of the shoes, but $10 represents another cost plus a profit to the seller. The cost to the owner of a structure represents the constructor's cost plus a profit, provided of course that the constructor used good judgment and had good luck.

However, for practical purposes the term "cost" is plain and means the cost of an object to the person addressed. In this sense costs, actual costs, are definite facts, and no amount of accounting can change the facts, though it is frequently true, especially on public work done by force account, that bookkeeping is used to conceal rather than reveal the true costs. This is borne out by laws recently passed in several states which make it compulsory that the accounting on such public work show the true cost, and wherever this has been done, it has been shown in most instances that the work can be done cheaper by contract than by force account.

To closely estimate the probable cost of a proposed project requires first of all good judgment and an analytical mind. Experience in the same or similar lines is a great help in developing good judgment, especially in estimating labor costs. The cost of materials entering into a structure can usually be determined with a reasonable degree of accuracy, for usually this cost is but another person's selling price. The object to be attained by the estimator in regard to cost of materials is to find the cheapest available material that will meet the requirements of the plans and specifications of the engineer or architect, and the usual procedure is for the estimator to take data gathered from his own experience, or from the records of others, and by a logical process of reasoning determine to his own satisfaction what the probable cost of the proposed work will be. The greatest chance for errors in this process is when the estimator fails to take into consideration all of the many different conditions which are always present and which tend to make no two jobs alike in every particular. This is especially true with reference to those things that affect the cost of the work directly, and also when the data used was gathered and recorded by some person other than the one making the comparison. This accounts for the trouble an inexperienced estimator often gets into when he tries to apply data obtained from any of the standard handbooks of cost data to an estimate of future work.



The systems used by constructors in preparing an estimate of cost are perhaps as numerous as there are constructors. As in every line of business it is necessary that the system used serve fully the purpose for which it is intended, and yet eliminate as much labor and expense as possible. The system used by me has been developed through a period of ten years of use and is now established procedure. Some of the fundamental principles and operations of this work are as follows:

The first thing to be done, of course, is to study the plans and specifications, take off a complete itemized list of quantities of all work to be done, and make extracts from the specifications on all matters of importance. This is done on sheets ruled for the purpose and of a distinctive color, and these sheets are filed as a permanent record. Sufficient notations should be made on the quantity sheets as the items are listed so that anyone can at any time check the take-off or extensions pertaining to any single or particular part of the structure.

On all important jobs there should be two, and sometimes three, independent estimates made of the quantities of work to be done. The totals of each class of work are then transferred from the quantity sheet to the cost sheet, which is suitably ruled for the purpose, and for convenience and quick identification, is of a different color.

This cost sheet shows not only the amount of work to be done, the unit and total costs, but also shows in detail how the unit costs were determined. This important feature of showing in detail on their permanent record how the price per cubic yard of concrete, etc., was arrived at is overlooked by some estimators. They often do all that work on scratch paper, and after it is destroyed it is hard to locate errors or check the accuracy of an estimate; or if not destroyed, this information is usually not available on short notice and not clear when found.

There are several reasons for making these details a matter of orderly-arranged permanent record. In the first place, it costs no more than it does to do the same work in a slip-shod and haphazard manner, and it is a source of satisfaction to the constructor and tends to eliminate errors to have the records in such shape that they may be checked intelligently by anyone.

Also it has happened in the past and may happen again that the engineer or architect may decide to make a few changes in the plans between the time the estimate is made and the time for starting construction. If the constructor was required to turn in his plans with his bid, as is often the case, the only way he can detect such changes is by his own records. Constructors, as well as others, occasionally find themselves in court, and if original records are complete and in detail and arranged in an orderly manner, it makes a better impression on the court and jury. I know of one case where a constructor of the old school lost a just claim in court because all the records he could show of his complete estimate of a $65,000 job were a few figures on one side of a piece of letter-size paper and on the back of a No. 10 envelope.

Complete records also make a favorable impression with banks and bonding companies and serve to increase their confidence in one's ability to carry on the business successfully. Complete detailed estimates of quantities and costs in the office have a salutary effect on the field organization during construction. It is human nature for the field man to excuse his high costs by claiming the estimates are all wrong, which can frequently be proved if you do not give him a complete detailed statement showing just how the estimated costs were arrived at.

To get a low cost in the field, you must first convince the field man that the work can be done for your estimated cost, and the best way to inspire him with this confidence is to show him the line of reasoning used in arriving at the estimated cost, that similar work has been done at this cost, and that a competent man can do it again.

As several weeks or months generally elapse between the time of making the estimate and the time of doing the work, it can readily be seen that it is important that the estimate be in such shape that it can be checked and verified by anyone at any time.

Finally, in an organization of any size, no one man can do all the work, and it becomes necessary and desirable that more than one person work on an estimate for the preparation of a bid. In this case it is obvious that the different men in the organization must do their work in the same general way and commit everything to paper and not depend upon their memory as a storehouse for important facts and details.

Another important and fundamental idea in dealing with costs from the constructor's point of view is to co-ordinate the cost of keeping and cost estimating. The system used in keeping and recording actual cost obtained on work under construction must be such that the data so obtained can be readily used in estimating future work. Conversely, an estimate of cost should be so arranged and detailed that when the work is being done, the actual cost obtained is readily comparable to the estimate. In this way we improve our judgment by actual experience and at the same time we have a guide by which the cost of work under construction can be still further reduced.

I believe it is better to first estimate the "field" cost of a job—that is, the labor and materials actually expended and used in the field and which go directly into the work, and then add at the end of the estimate the overhead and indirect items. In most cases the field labor cost is the important variable item, and the one the field superintendent is responsible for; and it is the item that often turns an estimated profit into a loss.

The term "overhead" means different things to different people, but, as generally used, it refers in a broad way to those items of cost that are charged to a job as a whole, and which cannot often be charged to any particular item nor class work. Our practice in a case of this type is to divide it into job overhead and general overhead. By "job overhead" is meant those items of expense incurred by that particular job, such as job supervision, watching, waterboys, liability and builder's risk insurance, rentals and depreciation on equipment used on the job, field office expense and premium on bond, etc.

"General Overhead" refers to the cost of doing business or expense of main office and includes salaries of officers and executives, general supervision, office rent, cost of estimating, etc. This item is pretty nearly constant, regardless of the amount of work done. It, therefore, is important that the constructor keep a proper relation between the amount of his general overhead and the amount of work he can reasonably expect to do; for if his overhead is relatively high he will not be able to meet competition, and thus will not secure work to do. Or if he disregards the cost of overhead in his estimate, as some have done, he is surely doomed to quit business sooner or later. This item of overhead, because it is easily overlooked, consciously or unconsciously, is perhaps the cause of the downfall of new concerns in the construction industry more than anyone single item of cost estimating.

What is perhaps a source of wonder to owners, as well as to engineers in charge of work, is the reason for the great variations in bids from constructors for doing a certain specified amount of work. It is perhaps only fair to state that it is also true that some of the bidders on a job wonder how some of his competitors arrived at the amount of their proposals. Some of the things that cause wide variations in the proposals are as follows:

First: Sometimes a constructor does not want the job, but bids on it as a matter of policy. He, therefore, does not spend much time on his estimates and plays entirely safe by bidding high.

Second: A man may bid on a class of work that he is entirely unfamiliar with, and if he has no records of former bids of similar work to judge by he may be ultra conservative in his estimated costs, or he may be exceedingly low.

Third: It is a fact that occasionally crooked constructors or those entirely irresponsible put in a wild bid, usually much lower than the work can be done for, hoping by some trick or by some accident to get the job at an adjusted figure which will net them a profit.

Fourth: Errors in interpreting the plans and specifications often lead to large variances. This is especially liable to happen where only one man works up an estimate, and shows the importance of having at least two complete and independent estimates of the quantities of work to be done, and preferably by two different estimators.

Fifth: Occasionally a bidder will have inside information that the other bidders do not have, as to an impending drop in the prices of some materials of importance, or to proposed changes to be made in the plans after bids are received.

Sixth: Perhaps the greatest cause for wide variations in bids is a simple error in the estimate, usually in the addition or multiplication. I have compared estimates with a great many contractors after the letting of jobs, and can say that in 90 per cent. of the cases all great variations were found to be in the simplest of operations in preparing the summary of the estimate; what is commonly called a "bust." For example, in preparing an estimate of a building with eight or ten typical floors, it is an easy matter to include one floor too many, or one floor too few; that is, third to ninth floors inclusive are often taken as six floors.

(*Continued next week.*)

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—Elbert Hubbard.

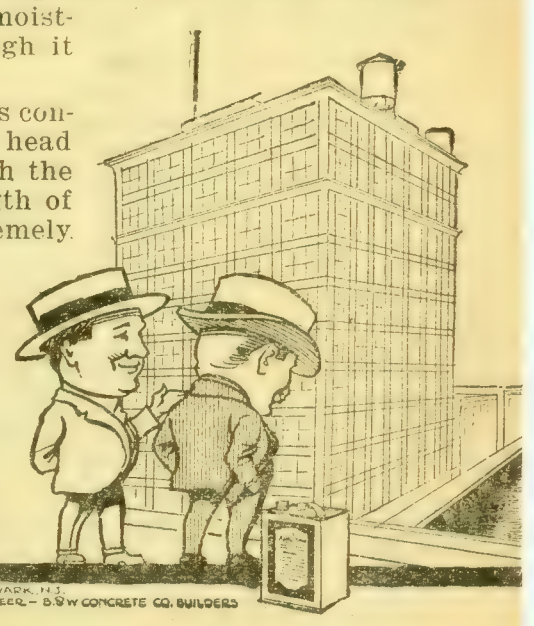
"ANTI-HYDRO" Keeps a Canal Out of this Building



The concrete basement wall is also the canal wall. Water flows co tinually against the outside, but the inside of the wall is dry as a bon

This concrete wall was waterproofed with "ANTI-HYDRO" thi teen years ago. Not a drop of moisture has ever penetrated through it during all these years.

"ANTI-HYDRO" waterproofs concrete *permanently* against any head of water. It also increases both the tensile and compressive strength of concrete and makes it extremely hard, all in *one operation.*

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. It mixes readily with the gauging water without the aid of skilled labor.

For 22 years "ANTI-HYDRO" has been the accepted standard. Be sure to use it on your next job.

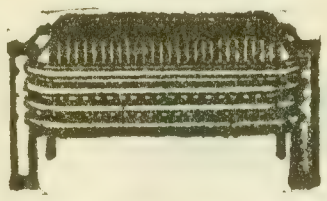
WHAT IS A FIRE INSURANCE AGENT?

What your agent is to you depends largely upon what you give him opportunity to be.

He may be only an executor of the usual commissions falling to the insurance agent—



Or, he may be your insurance advisor, pointing out how unnecessary hazards may be eliminated, and how the fullest protection is to be secured for the least money.

He prefers to act in the latter capacity, and there is no added cost to you for such service.

ANALYSIS OF COST RECORDS IN CONSTRUCTION

Neglecting to Analyse the Plans and Specifications Carefully Has Caused Many Contractors and Builders to Sell

By E. W. ROBINSON, *Civil Engineer, McKenzie Construction Company, San Antonio, Texas*

(Continued from last week)

As the estimator's experience broadens he learns from his experience, and from the experience of others, a great many things affecting costs that may appear surprising on first thought. For instance, it is common practice by many to estimate the labor cost of placing wood trim in rooms, such as picture moulding, chair rail and baseboard at a certain price per lineal foot per member. Thus a three-member base would cost 50 per cent more to place than a two-member; yet in most cases, if a good job is required in fitting the base to the plaster wall, it may actually cost less to place three member base than that composed of two members.

Anyone will likely agree offhand that it should cost more to shovel by hand crushed stone than rounded gravel; and without further analysis to estimate the shoveling of all crushed stone alike. Yet, crushed stone of certain sizes, or where it is of uniform size, as it is for sprinkling filters, costs more to handle than a mixture of varying sizes. Also crushed trap rock weighing 3200 pounds per cubic yard will be more costly to handle than crushed limestone weighing 2500 pounds per cubic yard.

This is not only because of the weight of the stone itself, but because there seems to be a tendency for it to separate from the mortar in handling when used as a concrete aggregate.

There is a tendency for a person seeking information as to cost of mixing and placing concrete, for example, to watch a job under construction, count the number of men working, find out the number of cubic yards placed in an hour or a day, and take that as the labor cost for estimating the doing of similar work. Not only does such an estimator generally miss the lost time every job is subject to, but data taken in the morning when the men are fresh will not be comparable with what the same men may do in the afternoon when tired. Nor is work done on a cool day properly comparable with that done on a hot day.

Also if there is an extensive plant used in placing the concrete the casual observer does not get the cost of moving and preparing the plant for each run of concrete. The writer knows of two jobs where this cost was one-third of the total labor cost of placing concrete where the yardage involved amounted to 9000 cubic yards.

Inverted concrete spandrel beams on a building or through concrete girders on a bridge look the same as other beams and girders on the plans, but the labor cost of forming and placing concrete is from 25 to 50 per cent. higher than it is where the slab is at the top of the beam or girder Another matter of concrete design calling for additional labor cost is where the widths of beams cannot be formed with stock widths of lumber.

Also timber structures must be studied closely for waste in cutting from stock lengths of lumber. It has been found that frequently workmen will shovel and wheel gravel or crushed stone to a concrete mixer and take the concrete from the mixer at a cheaper price per cubic yard than they will shovel and wheel the same material the same total distance. All of these and many others of similar nature are usually gained from actual ex-

perience and generally at some cost.

Some of the things which make one vary his estimated costs between jobs that to the inexperienced observer might appear to be identical in every respect are as follows:

First: *Market Conditions.* The tendency of the market for materials that go into any proposed job must always be taken into consideration, but especially is this important during an abnormally rising market. During 1919 and 1920, it was practically impossible to keep up with the market, for quotations on a great many materials of construction during this time were made subject to revision of price without notice. In many cases no assurance would be given as to delivery after orders were placed, and cancellations of orders were frequent.

Second: *Weather and Season.* While it is not considered good form to predict the state of weather in certain parts of the country, yet the probability of a wet or dry year would justify a liberal or close estimate. Also the time of year when the work will be executed might easily influence the proposal.

Third: *General Contingencies.* These refer to possible losses that may be suffered by acts of God, unknown sub-surface conditions, strikes, both direct and sympathetic, etc. The hazard from these things vary as to the nature of the work, location, time of year, etc.

Fourth: *Labor Conditions.* This refers to both the supply and efficiency, though to a great extent the latter is dependent upon the supply. Along the Mexican border the supply of labor is generally plentiful, but also generally inefficient. The supply of common labor in central and north Texas usually decreases during the cotton picking season and must be reckoned with in the estimate where common labor is an important item. At the present time a constructor should be liberal in estimating labor on brick work and plastering in almost any part of the United States on account of the scarcity and inefficiency of mechanics in these lines, and the constantly increasing rates of wages they are demanding and receiving.

Fifth: *Available Supervision.* On large jobs it may be economical to obtain a field superintendent of special qualifications to look after the work, but on the general run of jobs it may not always be possible to get the man best qualified for the particular work. It is economical generally to keep one's permanent personnel as constantly employed as possible, and other jobs or unforeseen conditions may make a last moment chance desirable.

Sixth: *Available Equipment.* The same things are true with regard to equipment as with supervision.

Seventh: *Overhead.* As stated before, general overhead is pretty much a constant expense, yet on a proposed job where it is evident that more than the usual attention will be required of the main office, an additional allowance over that usually allowed should be provided in the estimate of cost. This is true of some jobs located at considerable distance from the main office, and where traveling and other transportation expense will be unusually heavy.

Eighth: *Engineer's or Architect's* Reputation. A young or inexperienced engineer or architect in charge of work will often justify a more liberal estimate of cost than would otherwise be figured. It is also true to human nature for a contractor to figure a rock bottom price for his work if the engineer has a reputation for not only being competent, but for being absolutely fair in all his dealings with contractors in the past.

No reputable constructor can have any objection to the engineer insisting on everything called for in the plans and specifications, both as to quantity and quality, but cases have been known where the engineer or architect had a habit of insisting on more or better work than that specified without additional compensation.

It is generally conceded that both parties to any contract have rights as well as responsibilities, and that the engineer or architect on a piece of construction work is supposed to be a fair and impartial judge between the two parties. One important thing that is conducive to a low estimate of cost on the part of the constructor is for the engineer or architect to have a general reputation for exerting something like the same energy in defending the rights of the constructor as he does in defending the rights of the owner.

A careful perusal of the specifications of an important job totaling $100,000 disclosed the facts that the contractor had only "duties" and "responsibilities," while the owner had only "rights." This in itself may mean nothing, yet it tends to show the state of mind of the writer of the specifications, and if the prospective bidder has nothing else by which to judge the engineer he would likely re-

(Continued from page 664)

frain from figuring as low a cost as he might if he knew positively he would get an even break on all differences that might arise.

Ninth: *Lack of Time to Prepare Bids.* The engineers of Texas generally allow plenty of time for the constructor to prepare an intelligent estimate and proposal. However, many architects do not realize the importance of this feature. It is common practice in some sections for an architect to send in a set of plans for a $75,000 job on Monday, make the contractor return the plans on Thursday, and have the proposal in by Saturday of the same week.

This tends to produce wild bids, both high and low, and frequently causes general dissatisfaction between owner and architect, and architect and contractor, which would all have been eliminated had all bidders had ample time to prepare their proposals.

Estimating by guess will, by the law of averages, lead to failure sooner or later. One important factor in securing low bids from reputable contractors is to give them plenty of time in which to prepare their estimates of cost. In this connection the engineer should remember that in order for the constructor to do economical work he often must bid upon and construct more than one job at a time, and thus make allowances for this fact.

Tenth: *Complete Plans and Specifications.* Clear and complete plans and specifications invariably cause an estimator to figure close and conversely. Plans that are ambiguous and contradictory cause him to increase his unit prices or allow abnormal amount for contingencies. Especially is this true if he has reason to think the engineer or architect will insist upon the more costly interpretation of doubtful points.

The following are some extracts from actual specifications for work on which I have prepared estimates of cost, and illustrate one prolific source of grief to the estimator:

1. "The fine and coarse aggregate shall not be piled so near each other that the edges will overlap. Aggregations shall be preferably stored on platforms, so that the material in the bottom of the pile will not become mixed with dirt. Crusher run stone, bank run gravel, or mixtures of fine and coarse aggregate prepared before delivery on the work shall not be used."

The above was written by a corporate member of this society and was the only reference regarding concrete aggregates made in the specifications for a $30,000 job. Nevertheless, over one-third of the sand and crushed stone from sources heretofore acceptable by this engineer was condemned as not meeting the specifications. It was disclosed that the stenographer omitted one whole paragraph, amounting to more than a page, when the specifications were copied, and that it was the engineer's intention to specify sand and stone for this job of a character different than he usually required. But how was the bidder to know that from the specifications? Needless to say that both the contractors and material dealers lost money on this job.

2. "Contractor will frame all roof and wood ceilings joists of material of dimensions and sizes as marked on details, all to be No. 1 lumber, free from knots, defects and imperfections that will tend to weaken its strength and durability. All to be securely and well fastened into place, securely and well nailed, using a sufficient number of nails to carry the stress to be imposed upon the different members. Architects are to be the judges of the security of this construction.

"Framing of all lumber portions of the building must be done in a first class manner, according to the best common practice and this best common practice to be passed upon by the architects as to its fitness."

No sizes of lumber were given on details. This was taken from an architect's specifications for two school buildings totaling $225,000.

3. "The brown coat throughout shall be of plaster and clean, coarse, sharp, approved sand, in proportions of one sack of plaster to six ordinary size pails of sand. It shall be worked with a six or eight-foot straightedge, etc. . . ."

Inquiry disclosed the fact that stores sell pails in six, eight, ten and twelve quart capacity, and that it is hard to determine what was an ordinary sized pail. This is from specifications for plaster work on a series of public buildings amounting to over $1,000,000. This may help to account for the fact that the plaster sub-contractors in that vicinity have the reputation for using an excessive amount of sand in their plaster.

4. "All concrete surfaces shall be reasonably true and even, free from pockets, excessive depressions or projections. Unless otherwise specified, the forms of all vertical surfaces that will not eventually be covered with earth (and of such other surfaces as may be indicated by the engineer) shall be removed as soon as the safety of the work will permit (usually in not less than 24, nor more than 48 hours) and the whole surface then rubbed with a wooden float and clean water until form marks have been removed, leaving the surface plane, smooth and uniform. In addition to this float treatment, the *exposed* surfaces of concrete walls shall be rubbed off with a carborundum float in a thin grout composed of water and neat portland cement."

The above is from specifications for a large job, principally consisting of concrete tanks and reservoirs, and inquiry as to exactly what surfaces were "exposed" and to be finished in the above manner, brought the following from the engineer:

"The correct method of finishing all *surfaced* inside walls is with the float and later carborundum float, since this is exposed surface. All outside finish, excepting that which is to be covered over with earth, so as to make the job in all respects neat and workmanlike in appearance."

Now the above is quite plain, after giving the matter the proper study, but would it not only be human if the estimator should be led astray in determining just what is required to be done, and could it not have been stated in a much more simple manner?

5. "The omission from the contract documents of express references to any labor or materials reasonably to be inferred therefrom and necessary for the proper execution of the work, shall not relieve the contractor from furnishing them of a kind in keeping with the general character of the work."

This is from specifications for two buildings of expensive construction amounting to $100,000. Is it unreasonable to infer from this paragraph that the writer of these specifications is acknowledging beforehand his own incompetence or laziness? In cases of this kind, the bidder must either be as good a designer as the architect, or else be lucky to be able to land the job on open competition and yet make a profit on his work.

The following is typical of a phrase frequently found in specifications:

"For all delays and extra work occasioned by such mistakes, contradictions and omissions, real or imaginary, the contractor shall be considered responsible for not having them explained or corrected beforehand."

6. "The general contractor is not to include the cost of the other contracts, as here listed: Plumbing, heating, electric wiring, electric fixtures and finish hardware."

In the same specifications under the heading of "Finish Hardware" it states, "the contractor shall allow the sum of $1500 for all finish hardware."

Under the heading of "Terra Cotta," it also states:

"It will be noted that the general contractor will include the cost of setting the terra cotta only, and allowance for cost of terra cotta f. o. b. cars—will be furnished him by the owner and included."

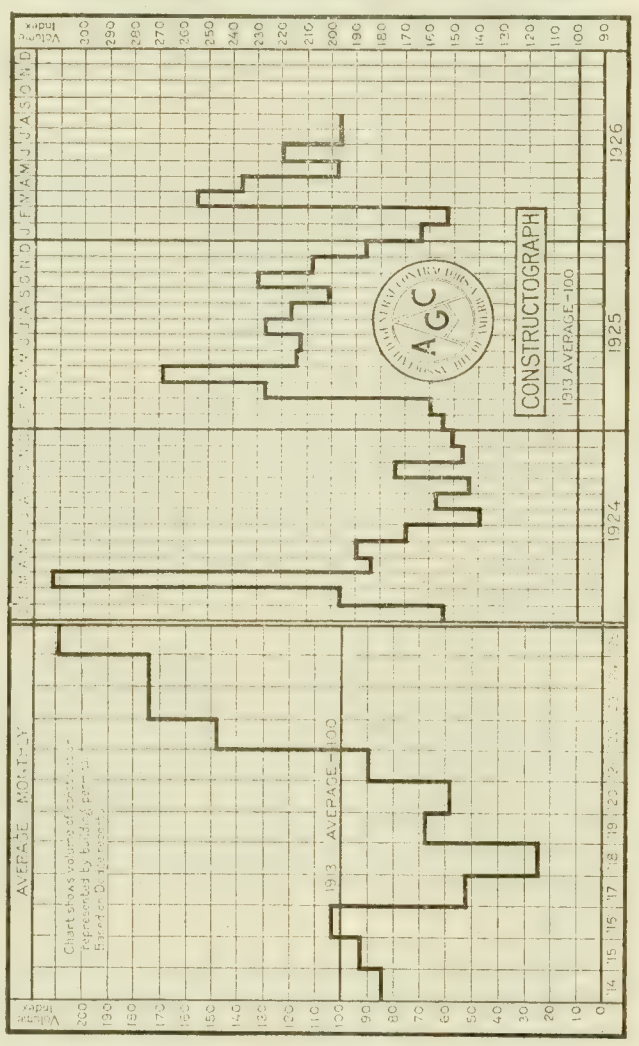
The above was from specifications for a three story, modern store building of

considerable area, and it happened to be one of those cases where bids were desired in something like a week's time after the plans were ready for use. The architect for this job is a fine fellow personally, but has the reputation among contractors of not "standing hitched" on his own decisions, especially when the owner has a whim or takes a notion to change his mind.

7. On the plans for the $275,000 worth of buildings the only reference to depths of footings below the original surface of the ground were as follows:

"Footings to go to solid rock"—and in another place—"footings to go three feet six inches deep, or to solid rock."

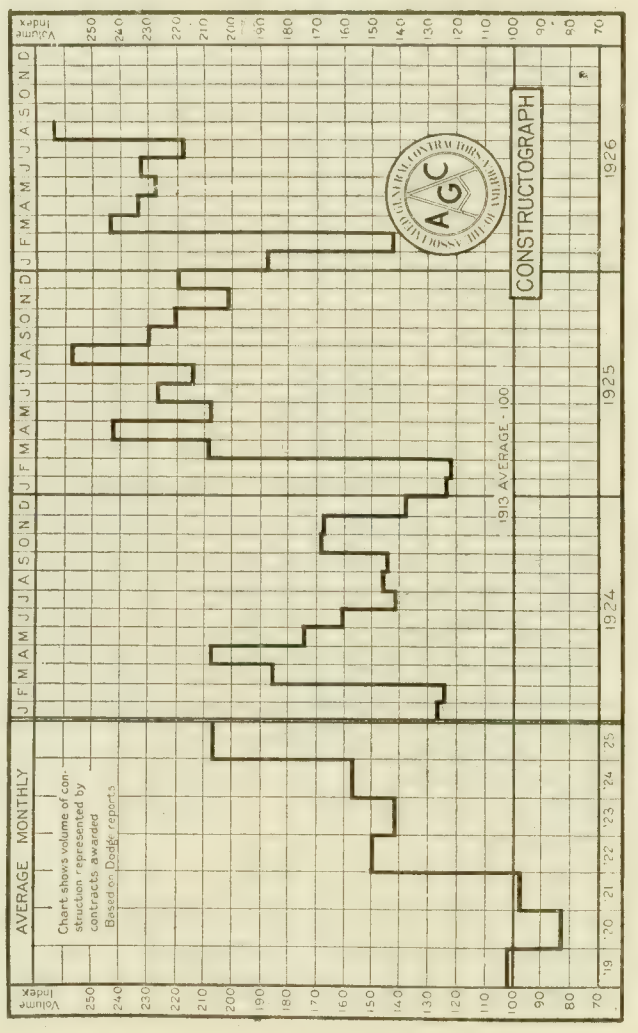
No original ground line was shown on the plans, but the finished grade is shown with notation, "future grade to be established by the architect."



In this case it was generally known that solid rock varied from one to ten feet below the original surface of the ground. Whether it was in the mind of the architect for the footings to go to solid rock as a maximum depth and to a depth of three feet, six inches, as a minimum, or whether they were to go to solid rock, provided same was not over three feet, six inches deep, or to the latter depth as a maximum if solid rock was not found at that depth, is the problem to be solved.

Now in conclusion, what is it all about? The engineer may say that he cannot be bothered with these details that affect the cost of his projects, that most contractors do not see them and will bid the same regardless. It is true that most contractors overlook some of them, and some contractors overlook all of them, but more and more the operation of the law of the survival of the fittest is coming to apply to the construction industry, the second largest industry in the country. With competition among builders becoming keener each year, those who do not analyze the requirements of the plans and specifications of proposed work carefully and thoroughly, are sure to fall, either from lack of work or from taking jobs at a price which precludes a fair profit. In the long run the owner pays the cost, either directly or indirectly.

Strong assurance that 1926 will see all previous records for construction activities eclipsed has presented itself. Not only is the volume of building operations for the first nine months 3 per cent. greater than the volume registered during the corresponding period of 1925, the high year to date, but a vast amount of contracts have recently been awarded and will soon be carried out to make the total for this year reach an astounding figure, according to statistics compiled by the Associated General Contractors of America.



The volume of building contracts awarded during August was the greatest registered in any month on record, exceeding the previous high mark, set in

Building Permits in 20 Cities

August, 1925, by more than 2 per cent. The total volume of contracts awarded during the first eight months of 1926 exceeded by 10 per cent. the corresponding figure for 1925.

Building Contracts in 27 Eastern States

This vast activity in the awarding of contracts, backed up by the actual fact that construction operations are keeping well ahead of the record-breaking pace set last year, is forcing close students of the situation to the conclusion that more money will be spent this year for construction than ever before in the history of the country within a similar space of time.

The volume of awards during August reached index number 264 on a scale having as its basis the average for 1913. It is interesting to note that the index figure for August, 1924, was only 169.

TO— OR NOT TO—

Hamlet's famous remark has probably been paraphrased as much as any other quotation ever made. And perhaps it has been paraphrased to read "To build—or not to build" as often as for any other thing.

Regardless of conditions, there is one safe rule to use anent building, and that is this: "Build whatever you need, *when* you need it!" If you need a home to improve your living conditions, to better the health of your family, or for any other good reason, the time to build that home is when that need arises. Similarly a good time to build a home is before renting has become a habit. Newly married couples should build homes, so that the common interest may draw them closer together. Home owners rarely patronize the divorce courts.

And to those who have been contemplating building, but for some reason or other are delaying, let us say that *now is the best time to build.* We base that assertion upon the facts that from October 1st, 1925, to April 1st, 1926, either excessively wet or very cold weather delayed numerous building projects. In May, labor troubles further delayed building projects, and June, July and August have not seen a resumption to normal. Added to that, building material prices are at the lowest levels that have obtained in years. Common brick retail at $12.00 per thousand—a price that equals the Chicago common brick price.

Inasmuch as price comparers have used the Chicago common brick quotations for years, and in view of the fact that Chicago has the greatest production of common brick in America, it is worthy of note that Cleveland brick makers, with a pitifully small market as compared to Chicago, have been able to make the price so low.

Common brick are used in almost every sort of building. Without them, the building industry would halt. Hence, when the universal material is low priced, it must follow that other materials are equally low in cost.

Hollow tile is now priced very low, and cement is at an unusually low level. Sand has been low for years. Lumber

prices can't fluctuate a great deal, for certain fixed charges, such as freight, do not vary, and lumber is taking longer hauls now than ever before.

With prices low and stabilized, and with most trades anxious to work, it seems to us that *now* is the best time to build that home of your own.

We make this statement in spite of the fact that the painters and glaziers are still deadlocked in an effort to force a wage increase and a 5-day week upon an unwilling public which has not had a pay increase, and works 6 and even 7 days a week to make a living.

The other trades—particularly the bricklayers—seem to be more interested in gaining the time they lost due to bad weather last winter, and in maintaining existing wage scales, than they are in gouging still deeper into the public purse.

In other words, some sanity and reason is percolating into certain trades—a condition that is a sure indication that NOW is the time to build.

—*Building Industry.*

EYESORES ARE VITAL ISSUES IN EVERY AFFLICTED COMMUNITY

Every village, town and city in the United States has inherited its eyesores from its immediate ancestors. No blame is attached to the heirs for accepting their heritage.

But considerable blame may be attached to them if, through indifference or inertia, they permit a continuance of conditions which are disastrous to genuine community progress.

If a stranger were told in glowing terms of the headway made in American building and then were shunted on a journey over any railroad in any direction he would, in a short time, consider himself the victim of some sardonic jest.

For, at nearly every approach to a community and at nearly every station stop his eyes would be assaulted with unsightly buildings, ramshackle tenements, litters of rubbish, choked streets, the debris of fires long since extinguished and a whole panorama of riffraff—the sweepings of community unconcern and easy-going apathy.

And, as a rule, blemishes of like nature would be found in other neighborhoods throughout nearly every commonwealth in the country.

NO PLACE IN AMERICA CAN AFFORD THAT KIND OF ADVERTISING. THE LOSS IT CAUSES TO EVERY COMMUNITY IT AFFLICTS IS BEYOND COMPUTATION.

What does it avail the Chambers of Commerce, the better business movements and kindred organizations to talk and write glowingly of the beauty of their town or city and then confront the alighting prospective citizen or investor with the precise opposite?

Why prate of civic virtues and industrial opportunities while the value of real estate sags and insurance risks mount to a point where the insurance companies withdraw?

True, a first class fire would probably provide a quick solution to a vexing problem if any guarantee could be made that the fire would be confined to the ugly area. But fires starting in such places usually end as conflagrations—the fine is wiped out with the coarse.

Why expect much progress from social service organizations when the real root of evil, crime and immorality lies in physical environment, in repulsive surroundings, in BUILDINGS which have all the charms of a sewer and none of its utilities?

To walk all around a vital issue and affect blindness to its existence smacks of pettifogging. Any policy of strangling truths will have little positive result. The people must be shocked into new attention to conditions of which long familiarity has made them contemptuous.

It appears to us that these conditions offer the building men of America a real opportunity to contribute to the cause of civic betterment and to speed progress in their own field of endeavor.

Property owners, real estate men, loan associations, builders, contractors and architects all have a stake at interest. The initiative might well be said to lie with them.

One method in starting a movement of this kind would be to show this editorial to the editor of the local newspaper whose previous work had proved him to be one who has labored for his readers always and for those who would exploit those readers, never. For rest assured that politics, good and bad, will show an active interest.

Such an editor's sense of news values, his interest in circulation and his trained imagination will leap ahead and grasp the full significance of this idea.

A series of articles photographically illustrated; testimony of conditions from fire insurance companies and others; appeals for close co-operation on the part of the Chamber of Commerce, women's organizations and other civic bodies; competitions for designs for improving a given locality; estimates showing costs of improvements—these are some of the essential factors in a campaign of this character.

The object is to arouse public opinion and awaken civic pride and then to focus these on whoever or whatever is responsible for present conditions. It will not be hard to prove that the people, individually and collectively, directly and indirectly, will profit immensely with the reformation.

TO ANY LONGER BEAR THE BURDEN OF "EYESORES" IN AMERICA IS WANTON WASTE AND SHEER NONSENSE.—*Building Age and National Builder.*

On Thursday, October 21st, 1926, Craftsmanship Certificates of the Philadelphia Building Congress will be awarded at the Poor Richard Club, 1319 Locust Street. This occasion will mark the second annual presentation of Certificates to men selected as Guildsmen, Craftsmen and Co-operating Master Craftsmen by the Committee on Awards of the Philadelphia Building Congress.

There will be present the President of the American Institute of Architects, the President of the Philadelphia Chapter of the A. I. A., the President of the Philadelphia Builders' Exchange and Employers' Association, the President of the Philadelphia Building Chapter of the Associated Pennsylvania Constructors, the President of the T-Square Club and other distinguished guests.

Assembly will begin at 5.30 P. M., and dinner will be served at 6.00 P. M., during the course of which the speakers will be introduced by D. Knickerbacker Boyd, President of the Philadelphia Building Congress. The presentation of awards will be begun at 7.45 P. M. by John I. Bright, Chairman of the Committee.

WATCH THE THERMOMETER

Mild autumn weather can build up a sense of false security in the mind of a concrete contractor that may easily prove his undoing. Without warning, the mercury can—and often does—drop sharply. Then the contractor who has freshly placed concrete is in difficulty unless his tarpaulins are in place and his salamanders are ready to fire.

Freshly placed concrete hardens more and more slowly as the temperature approaches the freezing point and there it is damaged. Be on guard when the thermometer may read in the fifties, forties or thirties.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear.

"ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement without weakening it and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 22 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

WHAT IS A FIRE INSURANCE AGENT?

What your agent is to you depends largely upon what you give him opportunity to be.

He may be only an executor of the usual commissions falling to the insurance agent—

Or, he may be your insurance advisor, pointing out how unnecessary hazards may be eliminated, and how the fullest protection is to be secured for the least money.

He prefers to act in the latter capacity, and there is no added cost to you for such service.

PHILADELPHIA
FIRE AND MARINE INSURANCE COMPANY

As The Editor Sees It

FIVE-DAY WEEK A MENACE; WOULD INCREASE LIVING, LOWER PRODUCTION AND GIVE EUROPE BIG ADVANTAGE

Presidents of Numerous Large Establishments Employing Thousands Upon Thousands of Workers Believe Henry Ford's Scheme May Be All Right to Meet Sales Conditions But is Too Impracticable and Dangerous For All Industries

Henry Ford's five-day-week scheme may be all right to meet certain conditions in his business, but it can never be adopted by the industries of the country generally because:

1. It would increase the cost of living.

2. It would curtail production to an alarming extent and make us more vulnerable to the onslaughts of Europe, now working as hard as she can to overcome our economic lead.

3. It would be against the best interests of the men themselves who want to work and advance.

4. It would create a craving for additional luxuries to occupy the additional time.

5. It could not be applied to the industries generally.

These conclusions are drawn by numerous manufacturers in all parts of the country and were made public by the National Association of Manufacturers which had been asked for a widespread expression on the subject of Henry Ford's latest move. Requests for an expression of opinion were sent to about fifty leading manufacturers, members of the Association, in all parts of the country and the responses came from organizations employing thousands upon thousands of workers. The opinions follow:

E. G. Scott, president, Smith and Scott Tobacco Company, Paducah, Ky.:

A five-day-week schedule, such as has been inaugurated in the plant of Henry Ford, is a legitimate aspiration for every American worker. But I cannot see how it is possible for such a measure to benefit the American worker under present conditions, for we are without the normal economic balance between this country and the rest of the world and have been for more than a decade.

Workers in Europe are pressing hard toward the rehabiliation of their economic situation while in America during that period business and industry have seen substantial prosperity.

The effect of the Five-Day-Week proposal would be to increase wages by something like 10 *per cent. And that circumstance would make American products still more vulnerable to the economic designs of Europe. In my judgment the effect of such a measure would be rather a loss to American workers at this time than a gain because further increase in production costs of American made goods will have the effect of heading workers toward an actual three or four-day week, or fixed part-time schedule through further limitation of the markets for the products of American labor.*

James Carey Martien, Lexington Bldg., Baltimore, Md.:

I doubt if it is feasible in many lines to have a man work forty-eight hours in five days and get the same results as are now gotten in forty-eight hours spread over six days.

Therefore, while admitting increased efficiency in certain lines of manufacturing, I believe the needs of the world today for increased production justify the thought that there should be no decrease

in the number of hours and this, too, because of its effect upon the individual as well as upon the industry as a whole.

Mankind does not thrive on holidays. Idle hours breed michief. The days are too short for the worthwhile men of the world to accomplish the tasks which they set themselves. No man has ever attained success in industry, in science, or in any other worthwhile activity of life by limiting his hours of labor.

Paul T. Norton, president, Case Crane & Kilbourne Jacobs Company, engineering products, Columbus, O.:

I am convinced that progress results from the development of sound ideas through the co-operation of a reasonably large number of persons, and I think you will find that only those changes have a marked effect on industry as a whole which can be adapted to the activities of a large number of individual plants and that when important changes do occur they nearly always result from experiments which have been tested out and found satisfactory in a number of smaller plants, even though some individual like Henry Ford may secure considerable advertising from the spectacular way in which he adopts same.

The question as to whether the American people can enjoy a shorter period of work each week, without curtailing the present steady improvement in the standard of living, will not be determined by the procedure of any single individual but by the earnest desire of all persons interested in industry to steadily reduce the large number of non-producing members of society who, while successful themselves, are naturally a burden on and a hindrance to the advancement of those workmen whose accomplishments are for the benefit, comfort and welfare of the people as a whole. By eliminating waste efforts it is possible to advance the standard of living of all the people to a point where occupation furnishes the real pleasure and any form of idleness is considered a calamity.

Charles Cheney, president, Cheney Brothers, silks, South Manchester, Conn.:

The American Federation of Labor have now made the five-day work week a slogan and announced that its establishment will be part of their policy.

I do not know just what has induced Mr. Ford to adopt this plan, but I have a surmise that he finds he can make in five days all that his market can absorb, in view of the increased output of cars made by other manufacturers which are of a grade to appeal to his former clientele.

The object of the American Federation of Labor is obvious. It is simply one more manifestation of the false philosophy which has guided them from the beginning, which is that restricted output increases the demand for labor and makes for increased compensation of the employe.

A rather curious new argument has been introduced into the discussion of this question. It is to the effect that inasmuch as the producers are also the consumers, they must be given opportunity and time to use and consume their own products; in other words, if those employed in making automobiles have one day a week off in which to use them, the demand for automobiles will increase. This may be true provided that the compensation for the five days is sufficient for the week's needs and for the setting aside of a surplus to be expended in an increased purchase of commodities. Obviously such a result can only be obtained when the output of industry and the profits of industry are large enough to permit of the disbursement of surplus funds arising out of a decreased output.

I do not think that the argument that industry will produce as much or more in five days of eight hours each as it does now in five and one-half or six days, can be taken seriously by a sober-minded man.

I think that it is very unsafe to establish basic principles regulating the operation of industry upon a short experience in a time of unusual prosperity. Certainly as the world becomes better balanced and as the equilibrium between America and Europe is re-established, we shall get back to a basis of competition in which it will be most difficult to maintain present margins. When the nations of the world settle down to a real steady competitive contest, that one which produces most efficiently will hold the leadership. *America has a great handicap at present over the rest of the world, but it can easily sacrifice that handicap by letting down upon its productive efficiency.*

To my mind nothing could be more unsound than the policy of the American Federation of Labor in seeking to reduce output. That philosophy strikes at the very root of America's prosperity. The rest of the world is now eagerly

Architect taking bids.

Residence, Wilmington, Del. Architect, R. Brognard Okie, 306 South Smedley street, Philadelphia. Owner, W. L. Edison, Wilmington, Del. Stone, hollow tile, stucco, 2½ stories, electric light, shingle roof, hardwood floors, tile and marble work. Architect taking bids due as soon as possible.

Club House, Clayton, Del. Architece, R. C. Tindall, 814 Orange street, Wilmington, Del. Owners, Worth Steel Co., Claymont, Del. Brick, steel, stone, frame, 2 stories, 60x100 feet, shingle roof, pine and maple floors, tile and terrazzo work, steam heat, electric work. Contract awarded to W. L. Hadley, Claymont, Del.

(Continued from Page 680)

scanning American methods of production to learn why we are outstripping them and they are answering their own questions by stating that we succeed by making it possible to produce freely, without being dominated by hampering restrictions. The Labor Union policy of restricting output has Great Britain on its back and if they cannot cut loose from it the ultimate result will be the elimination of Great Britain in its struggle to maintain its place in world commerce. The final result will be the breakdown of the British Empire.

If we want to initiate a policy founded upon that philosophy the five-day week is a good way to begin.

W. L. Clause, chairman of the Board Pittsburgh Plate Glass Company:

As a means of curtailing production, when needful, the five day week is an excellent plan in industries that do not employ processes which are of necessity continuous. As to the question of adopting it as a permanent operative policy, however, I think there is reason for doubt.

The adoption of the eight-hour day has much better justification, not only because it lends itself to all twenty-four hour day operations, but because in many lines of manufacture, it has been found that men can do about as much work in eight hours as they can in ten, or even a longer period, but I see no reason whatever for assuming that men can do as much work in five eight-hour days as they can in six, as a man should be able to work at his maximum efficiency for eight hours.

Our country has grown and developed on its industry and thrift, and I think there is great danger that the present trend may go too far in the other direction, in both respects.

A. L. Humphreys, president, Westinghouse Air Brake Company, Pittsburgh:

If Henry Ford is entitled to any meritorious mention or a niche in the Hall of Fame for any achievement of his for the benefit of American industry, let it be accorded to him in the fullest measure.

On the other hand, when he tries to force an impracticable idea upon American industry and American labor for advertising or for the purpose of reducing expenses on account of the falling off of business, under the pretext that he is doing so in the interest of humanity, he is deserving of as much censure as he is credit for the good he has done in the past.

In saying this, I am convinced that I am expressing the view of practically every manufacturer and employer in this country. By his latest spectacular exhibition of changing the working hours in his plants, creating a week of five working days instead of six, he has done something which can only be applauded by himself. The plan is not only economically wrong and inimical to the best interests of the American working man, but it is also sowing the seed of unrest and dissatisfaction in the structure of our entire industrial machinery. I cannot conceive that Henry Ford in promulgating this plan had any other idea in mind than to add another chapter to his already long list of spectacular advertising feats, or else the conditions in his plants and factories had become such as to make a retrenchment in the working hours a necessary requirement.

The relationship which happily exists at the present time between American employers and employes does not call for the creation of an extra holiday. If an employ is forced by circumstances of a personal nature, or he wishes for private reasons to take a day off, there is nothing to prevent him from doing so. If he wants to go to a game of baseball or football or take his family to a picnic. he can do so without his employers making the slightest objection.

I am convinced that the average American workman does not want anybody—Mr. Ford or anyone else, to coerce him in curtailing his working hours by arbitrary compulsion.

A. H. Mulliken, president, Pettibone Mulliken Company, guard rails, frogs, switches, manganese, etc., New York and Chicago:

It is assumed by some manufacturers that employes could, if they would, turn out as much work in five days as they do in five and one-half days; that the additional time for recreation would benefit the men and their families; that it would lessen the grind of every-day work; that it would give opportunities, not only for recreation, but for study and attention to personal and family affairs that would be helpful.

On the other hand, the dangers of the five-day work week, in the opinion of others, who are equally qualified to judge, is that the workman—particularly the foreign workman, who is only partially trained in the advantages offered by this country—would abuse the additional time; would waste it in unnecessary pleasures, if not in vicious habits; it would mean a waste of the workman's energy; encourage a disposition to loaf; create a desire for many things that would be, not only unnecessary, but burdensome as to purchase and payment and involve men in debt.

It would also create among their families a desire for luxuries and to use the additional holiday for display and injurious amusement.

In other words, this time is wasted if employed in the doing of things which lead to injurious habits.

It is also plain that it is impossible, as a practical condition, for a man to produce as much work in five days as he does in five and one-half days. It is purely assumption that he can do as much in five days.

There is an economic loss in the five-day work week and, unless all manufacturers adopted a five-day work week, it would create such differences in the cost of production that prices would be affected, and they would be compelled to

return to the five and one-half day work week.

Unless every manufacturer in each industry works the same number of days or hours, the resulting inequalities would prove the failure of the plan.

In regard to Henry Ford's adoption of this change in working time, all manufacturers regard it, on his part, simply as a reduction in production to meet the falling off in demand for his product.

The question raised by this action of Henry Ford's is not of moment at this time and will not create any change in industry generally.

Robert P. Lamont, president, American Steel Foundries, Chicago:

Considering only his own business, Mr. Ford's announcement of a five-day week just before the meeting of the American Federation of Labor in Detroit was wise and timely. It no doubt fits perfectly into his present situation and will produce the required output at no increase in unit cost.

That the plan is not generally applicable at this time is evidenced by the fact that it is not to apply to blast furnaces or steel mills of the Ford Company. It will not have any more effect on the general situation than the earlier announcement of a uniform six-dollar-a-day wage.

It is not so long ago since a twelve-hour day was not unusual in many industries. There has been a gradual reduction in the hours worked per day and per week in industry generally and no doubt this will go somewhat further, but such changes will come gradually and as industry can adjust itself to them.

Philip T. Dodge, president, Mergenthaler Linotype Company, New York:

I am strongly of the opinion that it is impossible to establish in all industries the five-day week. However, in industries in which parts are duplicated in great numbers, mainly by machinery requiring little hand-work, and where products are sold at a large advance above cost, for example, in certain vehicles, the five-day week may be feasible. Certain it is that it could not be generally applied in the industries.

George L. Markland, Jr., chairman of the board, Philadelphia Gear Works:

The *work* of this country cannot be done in forty hours a week. I see in the movement a trend toward the *Arena.* Rome did that and Rome died. Most people who work do so with their hands and feet with no joy in their work forgetting their heads except their mouth.

The installment plan of buying is so prevalent throughout the country that there may be no reduction in the pay envelope, and with so much more time for the Arena the demand for things will increase while the production of things will decrease and without production there will be no profit, without profit there will be no work. Then we may all go to the Arena. The men of our country are becoming a race of softies and mollycoddles; it is time we stopped it and turned out some regular he-men—too many paternalistic laws by City, State and Nation. Any man demanding the forty-hour work week should be ashamed to claim citizenship in this great country. I see in it a gradual sinking into decay.

D. M. Weir, vice-president, Weirton Steel Company, Weirton, W. Va.:

The efficacy of a five-day week is somewhat doubtful even though the business or industry can accommodate itself to such a plan as seemingly can be done in automobile building.

In the five-day week the human element is the most important consideration. Eight hours work for five days or forty hours, leaves much time for recreation. Men working eight (8) hours hardly need more than that amount of sleep. That leave seventy-two hours per week for recreational purposes, or over ten hours per day. This additional eight hours of recreation coming on Saturday makes a long weekly holiday period, which will provide an excellent opportunity for additional expenditures.

From a financial standpoint it is hard to conceive labor can benefit by such a plan and it is reasonable to believe it would be but a short time until increased wages would be necessary to meet the increased expense incurred through the added holiday.

Is the human element being abused by forty-eight hours work? Certainly not in most lines.

Charles R. Sligh, president, Sligh Furniture Company, Grand Rapids, Mich.:

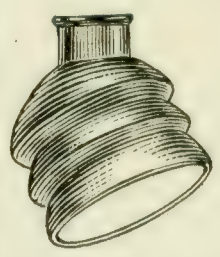
There are many industries in which, of course, it would be practically impossible to conform to these hours. The billions of dollars that are invested in the United States in manufacturing plants cannot afford, from an economical standpoint, to be utilized only forty hours per week. The taxes, interest on borrowed money and interest on investment will go on just the same whether plants are worked forty-eight and fifty hours a week or only forty.

This shortening of the hours would inevitably lead to an increased cost of living without any assurance that there would be an increased wage paid. The industries of the United States and the vast accumulation of wealth here has not been made through idleness but through industry and, in my opinion, it is a very regrettable fact that one occupying the position that Henry Ford does in the industrial world should for any reason expect to benefit industrial conditions by so much idleness.

H. W. Cook, president, A. E. Nettleton Co., shoes, Syracuse:

It is self-evident that manufacturers of automobiles will agree with Mr. Ford and favor shorter working schedules for all workers in industry. As recreation periods each week become longer, more automobiles will be required and consumed by use during such periods.

Too much leisure would unquestionably be bad for the working man.



Granted that present conditions are much more pleasing and conditions resulting, much more desirable, are they not as far as we can safely go for the present? With the Farmer still working long days and jealous of the leisure of the man in industry, can we, who look to him to a very great extent for our market, afford to antagonize him and make him still more unhappy about his own condition?

Of great importance, too, is the question of whether we are going to be able to compete in the world's markets, including our own, with our higher wages and shorter hours, against the lower wages and long hours of foreign labor.

For many years, since the War, the balance of trade has been greatly in our favor, but is now rapidly becoming equalized, and the imports of manufactured articles are becoming a real menace to some industries.

So far as domestic business is concerned, a sufficiently comprehensive and elastic tariff could be made protective enough to safeguard against any present difference, or any that might be made in the future in costs, due to our labor conditions. It would, admittedly, be unsafe to base changes upon a definite tariff policy. Our political parties are as far apart in their tariff views as the extremists on the question of working hours.

Again, if all manufacturers were actuated by a selfish purpose, and could protect themselves, as Mr. Ford does, by establishing three shifts of eight hours each in every twenty-four hours, they

might not care how many days a week for working might be established as a correct schedule.

Unfortunately, very few manufactured products lend themselves to a processing covering three shifts a day of continuous operation.

I feel strongly that we should go slowly.

Charles B. King, vice-president and general manager, the Marion Steam Shovel Company, Marion, O.:

As to good or bad effects resulting from the establishment by Henry Ford of the five-day work week in his plant, my opinion is that if there is any effect at all on the country in general from such a policy, it certainly will be bad rather than good.

If the five- day work week was established to curtail production in the Ford plants on account of decreased sales, it could probably be considered as good policy in order to retain the greatest number of employes on the payroll, at the same time reducing production by shortening the number of hours per week.

If, on the other hand, it was done with the thought of establishing a policy that might be followed by other manufacturers throughout the country, then the ill effects would be obvious—production would be curtailed and costs increased. When any movement results in reducing production and increasing costs, the public necessarily suffers, industrial progress is retarded, and an uneconomic condition is created.

John E. Edgerton, president, National Association of Manufacturers and president of the Lebanon Woolen Mills, Lebanon, Tenn.:

It is, of course, always possible for it to become uavoidably necessary for individual plants to shorten their hours or weeks under varying economic pressures. But let us not confuse the mandates of good business with the instincts of humanitarianism, nor mistake the disguised suggestions of economic necessity for the discovery of a superior economic formula. If a man does as much work in five days as he has been doing in six, either his energies are accelerated at the expense of his physical welfare or he has not been working as he was obligated to do; and if he be paid as much for five days' work as he has been paid for six, then either he has been paid less than a just wage or is receiving at the hand of charity pay for one day more than he is economically entitled to.

It is time for America to awake from its dream that an eternal holiday is the natural fruit of material prosperity, and to reaffirm its devotion to those principles and laws of life to the conformity with which we owe all of our national greatness. I am for everything that will make work happier, but against everything that will further subordinate its importance in the program of life.

Clarence E. Whitney, president and general manager, the Whitney Manufacturing Company, Hartford, Conn.:

I believe benefit will result for Mr. Ford, as he has made a wonderful record by efficiency, and it is probable he is not adopting an inefficient program at this time for his particular requirements under existing conditions.

The Ford plant is so highly specialized, it can, to a large extent, operate twenty-four hours per day for five days a week, thereby having use of the enormous investment in plant and equipment, for a greater number of hours per week than most other concerns can economically operate.

If the standard of one great manufacturer, having conditions different from others, should be thrust upon all manufacturers by legislation, the economic consequences would be serious.

Mr. Ford, I believe, could not operate all of his departments on a uniform program. If he were to make difficult special tools or machinery, on a mass production program, twenty-four hours per day, three shifts, passing the delicate work from one shift to another, I believe chaos would quickly result from the divided responsibility.

I cannot see the slightest danger for other employers, confronted with different problems and different conditions, so long as existing work laws are unaffected.

H. B. McCormac, president, Virginia Woolen Company, Winchester:

It may be that a shorter work week is necessary or desirable in the manufacture of automobiles. In this line of industry the most efficient mechanical equipment is used and the most intensive application of the workers' attention is required.

For other classes of industry a forty-hour week would certainly be harmful. The consequent reduction of units produced would considerably increase the cost. An increase of cost has always been regarded as decreasing consumption, and to this extent a reduction in the hours of the working week would be a step backward, rather than forward.

If we are to have equality of prosperity among occupations, we must have equality of industry, skill and intelligence or training. We need more goods—we can enjoy more leisure. Let's produce the goods and the leisure will follow.

Paul J. Kruesi, president, Southern Ferro Alloys Company, Chattanooga, Tenn.:

The public impression is exceedingly wide spread to the effect that Ford's present sales have dropped to the point where his normal force can readily make in five days all the cars his agencies can sell in six days. The rest of the country is content to wait and see whether in say a year's time, the Ford productin in five days equals what he used to produce in six, which I believe is his contention.

My own view is that the destruction of economic wealth resulting from the World War was on such a colossal and incomprehensible scale (even in this country where we built and then scrapped billions of dollars worth of ships, shipyards, nitrate plants and army supplies) that the work of the world cannot in this generation be done in five eight-hour days per week.

This is said without derogation to Mr. Ford, or lack of sympathy with the idea of ameliorating the condition of labor.

William W. Coleman, president, the Bucyrus Company, steam, gasoline and electric shovels, cranes, etc., South Milwaukee, Wis.:

It is true that during recent years the more efficient application of power, the increased productiveness of machine tools and like advances in the mechanical arts have resulted in obtaining the same or a larger product in less time. As far as can be determined from newspaper reports, there has been no claim made that the shorter week adopted by the Ford plants has resulted from any improvement in manufacturing processes.

If the action of the Ford Company was the result of a lessening demand for Ford products, a shorter work-week can readily be understood, for it would certainly be more economical to turn out a five-day week product in five days than to spread it over five and one-half or six days. Under such circumstances any discussion of the matter is entirely unnecessary.

Up to the present moment there does not seem to be any important reason why the action of the Ford Company should give much concern to manufacturers or employes generally, for what one concern may be able to do under one set of circumstances does not generally apply to an industry or trade at large.

(*To be Continued.*)

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Dependable Property Protection

The value of your insurance protection lies in the strength and service of the organization back of it.

A NORTH AMERICA policy stands for financial stability and prompt settlement with a minimum of trouble and delay.

Your agent can get you a North America policy.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America write practically every form of Insurance, except life

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear.

"ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement without weakening it and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 22 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

ARMSTRONG CORK HOUSES
AT DEVON, PA.

Six wonderful New England Colonial type houses, surrounded with old shade, and two minutes from Station.

Insulated throughout with Armstrong's Corkboard, 1½″ thickness on all outside walls and 2″ thickness on roof, effecting a fuel saving of at least 30% per heating season. All drafts are eliminated. A cork-lined house is many degrees cooler in summer. This is especially true of the upper floors.

Armstrong's Linoleum and Linotile floors installed.

Sample house is heated and open for inspection daily, 2 to 5 o'clock. Agent at Sample House.

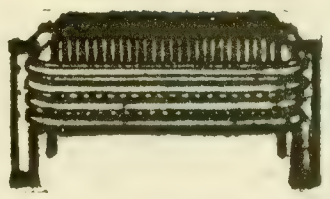
INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.



It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

As The Editor Sees It

FIVE-DAY WEEK A MENACE; WOULD INCREASE LIVING, LOWER PRODUCTION AND GIVE EUROPE BIG ADVANTAGE

Presidents of Numerous Large Establishments Employing Thousands Upon Thousands of Workers Believe Henry Ford's Scheme May Be All Right to Meet Sales Conditions But is Too Impracticable and Dangerous For All Industries

(Continued from last week)

E. B. Leigh, president, Chicago Railway Equipment Company:

In such a plant as that of the Ford Motor Company the five-day week could easily be made the means of meeting a lessened demand and over-production. There also are doubtless other industries, particularly those operating under a five-and-a-half day week, to which it could be applied with economic advantage, as, for example, those in which the workers are on a "piece work" basis of compensation, and without any substantial reduction in output, or lessened earnings to the workers. In some departments of our own industry we have found this to be true. It would not, however, apply to all industries.

On the other hand, where the workers are on a "per hour" basis of compensation, the shorter week would undoubtedly mean both lessened production for the plant and reduced earnings for the worker.

From the social standpoint the shorter week could be made advantageous to the worker, should he utilize the added leisure time in such ways as would contribute to his health, enjoyment and happiness.

George F. Reynols, the Portland Company, Portland, Me.:

It is hardly fair to judge the whole country by what Henry Ford does. Evidently he believes a five-day-work week is good for his business or he would not put it into operation.

I doubt if it has any effect on the rest of the country, either good or bad, as I believe the majority of industries will continue to work half a day Saturday unless there is some special reason to the contrary.

I do not believe that the average working man cares to have too much time on his hands, and he is much happier and more contented to be working, earning money, than he is to be loafing.

Robert J. S. Schwarzenbach, president, Schwarzenbach, Huber & Co., New York:

I doubt whether the time has come where five-day operation universally applied will produce the goods which the world needs, at a price which it can afford to pay. And if it has come, the question even then is open whether the five-day week—with a two-day week-end—is the best form for a cut.

Personally, I feel that cut operations, whether of a single or double shift nature, should be distributed over the Biblical six days of the week, for the reason, perhaps, that a two-day vacation every week interferes too much with good regular habits. It can be urged, of course, that the present Sunday so does now. But a Sunday of rest is one thing, and a hectic week-end—to which a two-day idleness so easily leads—is another. If the point should be made that some of us seem to enjoy the two-day week-end, I will say that, if a fact, it does not prove the two-day week-end a good intsitution.

H. C. Atkins, president, E. C. Atkins, & Company, saws, Indianapolis, Ind.:

The tendency in the United States has been toward shorter hours, larger wages

and the net result of the whole proposition is coming to the point where sooner or later industry in the United States is going to be like a "dog chasing its tail."

Enforced attention to business in my estimation is in the long run productive of better citizens than enforced idleness. The position of the United States at the present time, outside of one or two industries, does not justify enforced idleness, especially where that idleness is paid for by some one, somehow. What we need in industry in the United States is a policy which will enable us to command not only our own market, but foreign markets, and if God-given daylight and time is wasted by American industry, as it will be on a five-day week, somebody else is going to take advantage of that waste.

I am not so particularly interested in what the Ford Motor Car Co. may have in its mind in cutting down production as I am in the general proposition of the greatest good to the greatest number.

Fayette R. Plumb, president, Fayette R. Plumb, Inc., hammers, hatchets, files, axes, etc., Philadelphia and St. Louis:

Looking at the question of a five-day week from the standpoint of the worker rather than that of the employer, it appears to me that he must decide first whether he wants a lower standard of living with less work or to keep on raising his standard by sharing in the benefits of increased production, brought about by improvements in mechanical processes and management. If the movement for a 48-hour week to a 40-hour week should be gradual, improvements in the manufacturing and distribution processes might so offset the loss of "manpower hours" as not to cause any actual decline from the present standard of living; but it would keep the standard from rising as it otherwise would.

The only condition under which this would not be so, would be if the total production per man per week would be as great in 40 hours as in 48 hours, all other conditions being the same. As a matter of fact a uniform work week for all industries is a fallacy.

James F. Dewey, president, James F. Dewey Company, Quechee, Vt.:

Nothing to my mind could be worse for the working people of our country than the five-day week. To the majority of us the more time we have for idleness the more we spend.

Henry Ford has merely stirred up the old question, but it does not do any good as it gets us nowhere, but it does cause unrest. Idleness has never brought happiness. There is a great truth in that old law:

"Six days shalt thou labor."

Let us do it and be thankful for the privilege.

Joseph C. Kimball, of Kimball & Sherman, Haverhill, Mass.:

Undoubtedly a five-day week may fit into certain conditions in industry, especially when incoming orders slow up and a given demand can be supplied by part-time operation in the producing factory, but generally speaking, the length of the working week should be regulated by economic considerations rather than by legislation.

Increasingly, industrial products are becoming seasonal and should be so treated even in the length of time spent in their production. Especially is this fact apparent in all articles of wearing apparel and such as are molded or regulated by the element of style.

Good authorities state that style today, particularly in wearing apparel, is 75 per cent of the value of a contract and no unnecessary restrictions should be inflicted on industry from any source.

Competition in the foreign field is becoming more difficult and if the United States is to be a factor in export, all interested branches must contribute their part, whether it be capital, management or employe.

William L. Deming, president, The Deming Company, power pumps, hydropneumatic water supply systems, Salem, O.:

It seems like another drastic innovation on the part of Mr. Ford. If the writer were an intimate friend of his, he might be tempted to call Mr. Ford "Alibi Henry," because he apparently wishes to have it thought that his business conditions are independent of his decision to make the change in working hours.

It looks to us as though Mr. Ford is taking this course on account of the diminution of the amount of orders for his product, and as he got away with his plan of some years ago of paying no workman less than five dollars ($5.00) per day, he probably thinks that this proposition will also succeed.

The tendency for a time evidently will be to cause dissatisfaction among the employes in other factories and in other lines.

It looks to the writer as though it would be better for Mr. Ford to add another type of automobile to his product

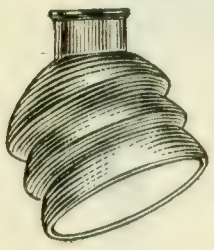
WORLD FAMOUS STRUCTURES

The Cloth Hall, at Ypres, Belgium

THE CLOTH HALL (Les Halles) at Ypres, Belgium, is the only relic which remains to prove the former greatness of this old city which, with a population of over 200,000 in the Fourteenth Century, had declined to about 5000 in the Sixteenth Century.



A building of prodigious size, the Cloth Hall stands in the great market place. It is in a rich style of Gothic architecture surmounted, in the centre, by a tower 230 feet high.

and not do anything that would tend to disarrange the established working conditions.

However, Ford is the autocrat of his business, and whatever others think will cause no difference in his actions, and we believe he will carry out his ideas at least as an experiment.

William H. Barr, president, William H. Barr, Inc., bronze castings, Buffalo:

What Mr. Ford might do, because of his peculiar position in the industrial world, cannot be a measure for all industry. Of course, Mr. Green tells us that

the American Federation of Labor workers will produce just as much in the five-day week as in the six-day week or five and a half-day week. That is unadulterated bunk. There is not a union man who will exert himself one iota more per hour to produce more goods simply because he finishes on Friday night and not on Saturday. If it is true that there may be more production—sufficently more to offset the lost time—it is a plain indictment of present methods of unionist work. The unions have always been opposed in every way, by speech, by legislative effort, by propaganda—to speeding up. Now they purpose to "speed up" so as to get a six-day wage for five days' work.

Henry Abbott, president, Calculagraph Company, New York:

Of course, if employers are going to play golf all day on Saturdays, they cannot consistently refuse the same privilege to their employes. Then the golf courses and country clubs will become overcrowded. If the employes motor with the family on Saturdays, the roads and highways will become congested and impassable on the last day of the week as they now are on Sundays.

The question whether workers *need* another day for rest, depends upon the character of their work. In some industries involving severe musclar or mental strain, or where work is performed in excessive heat, dust or gasses, all will agree that rest periods, fewer hours per day or fewer days per week are necessary as well as desirable.

The A. F. of L. in convention assembled, at the psychological moment, have grabbed onto the Ford idea and resoluted in favor of a universal five-day week. This attitude is as illogical and as unreasonable as their other proposition that all workers in a given industry should receive the same pay, regardless of skill, ability or productive capacity.

William A. Vawter, president Baker-Vawter Company, loose leaf and filing equipment, Benton Harbor, Mich.:

I am somewhat doubtful as to the effect on men who are employed but five days a week. It seems to me that all of us need the discipline of more, rather than less regular work.

Our own experience is that shortening the hours of labor decreases production. In our opinion, the ideal work week is fifty hours—nine hours on Monday to Friday, inclusive, and five hours on Saturday.

The unfortunate part about the Ford Plan is that it will add encouragement to labor unions to increase their efforts to reduce the hours of labor. This is unfortunate because we know their plan is to limit the amount of work done rather than to tend to increase it.

As far as we are concerned, we feel that we can continue to operate under our present plan without any particular attention to the Ford plan.

Rowland B. Jacobs, of Everett Knitting Works, Lebanon, New Hampshire:

It is recognized that here and there is a strong industry manufacturing a profitable commodity more or less non-competitive, with a country-wide distribution, in which the hours or days per week can be more or less adapted to the situation in which the particular industry finds itself, but our people feel that to force such a radical changes upon manufacturers in general would have a very serious and adverse effect upon the industries involved. This in turn would be most unfortunate for manufacturers, employes and the public alike.

W. G. Dickie, Kaw Paving Company, 630 New England Building, Topeka, Kasas:

No matter how much industrial production might be speeded up by improved machinery and more alert workers no gain in production could result that would permit a sufficient reduction in price of the products of industry to compensate the worker in agriculture for the longer hours that his industry requires. Since the producers in agriculture provide the great market for the products of our great industries the increased cost of production by virtue of the shortened week would fall largely upon his shoulders. Can he be made to bear the burden of longer hours per day, six days per week, and the increased cost of the products manufactured and not work both an economic and social injustice upon him? I do not think so.

"FIVE-DAY-WEEK" NOT APPLICABLE TO THE BUILDING INDUSTRY

Henry Ford's announcement of the five-day week for labor in the multifarious industries he controls will do more to bring this policy before the public eye than all the propaganda of the American Federation of Labor for the past ten years. There is no doubt that Mr. Ford's unique position in the Industrial World causes his announcements to be fraught with serious interest, not only to those in allied industries but to the general public as well.

The Building Business cannot witness the establishment of the five-day week in industry without seriously taking stock of what such action would portend if applied to the construction business.

The five-day week unquestionably has a strong appeal to many working men, providing it does not reduce their annual income. The philosophy of two full days of recreation out of seven undoubtedly falls into the spirit of the times and finds a wide-spread response among the prophets of ease and indifference.

However, the results of such a philosophy in the Building Industry by no means ends with the gratification of the working man's inclination. Its results will affect every proposed investment and improvement. In the Building Industry there has been no speeding up of production comparable to the enormous mass production achieved in mechanical trades. Buildings are still largely fabricated by hand labor. Concrete forms must be built by hand. Bricks are still laid by hand. No mechanical device has been developed to apply lath or plaster, etc. The result is that a specified number of working hours must be utilized in the construction of every building. The employment of more men for a shorter time does not solve the problem, as a certain number only can be utilized in every craft to economical advantage. Further curtailment of effective labor time in the Building Industries will, therefore, tend to increase the cost of construction in two different directions: first, by an increase in wages indirectly due to a shorter week for the same pay; second, by an increase in interest, taxes and other carrying costs, due to the longer period of actual construction required.

It is very probable that the Building Industry would be seriously injured should the policy of the five-day week be adopted, as the factors of additional cost enumerated above will unquestionably operate to make the promotion of new structures in any community that much more difficult.—*East Bay Builder.*

UP-TO-DATE HOUSE COUSTRUCTION

A few years ago, if one were told that it would be a paying investment to insulate a home or building to save the loss of

WE BUILD ANYTHING
LAND - ARMSTRONG & LATTA CO., PHILADELPHIA - WATER

heat during the heating season, and give a much cooler house, especially the top story, in summer, he would be very skeptical, but exhaustive tests and experiments have been made so that about two years ago the proposition was brought to the attention of architects and engineers with convincing data, and today the proper insulation of a house is an important question, both to owners and builders who intend to build, as the day is not far distant when a house not so constructed will be a poor seller.

Without question, the most economical insulating material for this use is sheet cork, applied to the walls and ceiling of top floor or roof, either against studs and joists or cemented to walls of tile, brick or cinder block, and wherever it is used, lath is dispensed with, and the plaster in two coat work is applied directly to the face of the cork with better results than on lath.

It has been definitely proven that sheet cork is the best permanent insulator on the market, and by experiments and actual practice, 1½-inch thickness for walls and 2-inch for ceiling or roof will give the best return for money invested, and it is further proven that an insulator of less thickness than this will not be the paying investment that the thicknesses stated are. Engineers and architects like Isaac H. Francis, Philip H. Johnson and others of note in their profession, are so specifying.

The savings effected by insulating a house along these lines are as follows: dispensing with lath when cork is installed, cutting the heating plant 25 to 30%, acording to building construction, and the absolute saving of 30 to 40% of fuel required during a heating season over that required for the same house uninsulated.

It is especially valuable where a gas-fired heating plant is installed, as has been proven.

In the last year in this location, many factories, power plants and hospitals have installed sheet cork on roofs, and an outstanding example is the new Bayuk Cigar Factory that has been insulated completely on the outside walls and roof with 2-inch sheet cork.

A great number of dwellings have been insulated and the results during the last heating season have proven all the claims made for this insulation.

Recently on the Main Line at Devon, Pa., six houses of Colonial New England type, designed by Tilden & Register, have been built of the best materials and workmanship, combining many up-to-date ideas, the most outstanding feature being the complete insulation with sheet cork, and in the sample house a comfortable temperature is being maintained with a minimum water temperature and fuel consumption.

These houses are on the Boulevard, surrounded with old shade and shrubbery, within a minute's walk from the station, and the sample house is well worth an inspection by anyone who contemplates buying a "built to order" house in the heart of a beautiful country, with unexcelled railroad facilities.

Expense of insulation if properly considered is only the first cost (about 4% of the net cost of dwelling) and this is soon absorbed by savings every year, besides satisfaction and complete absence of drafts.

Uninsulated houses are causing annually millions of dollars worth of heat loss, the seriousness of which loss is not realized because it is not actually missed and cannot be specifically appreciated.

AN IDEAL BACKGROUND

BY JULIA WOLFE

Too many apartments these days are decorated in gray, for it is an excellent background for pictures and ornaments. Of course gray and all the tones of gray are not decorative in themselves, though some contrasting color, which is to form the real color note in a room, but which is too strong to use in any but small quantities, can safely be used with it. It is therefore neutral.

Neutral tints and grays can not be obtained satisfactorily by plain painting in thick color. They must be obtained by combinations of color either stippled or glazed, and not by some mixture, which is the usual method. A neutral tint or gray tending in the blue direction should be over a bright light-blue foundation, and one in a browner tone over scarlet. The blue foundation may be stippled with white and grays to bring out the desired tint, and the scarlet with browns and whites. Several coats of stippling will be needed, but it is worth while, as one will get quite a different and a far more interesting result.

One can say that the pure grays range from white through all tones to black; the other neutral tints soon cease to be neutral and become brown or blue or green according to their alliance with these colors.

A north room should never be "done" in gray nor should a badly lighted room, as it will only look dirty; and when working in grays one must always bear in mind that an unclean effect is to be avoided at all costs.

The surface of light gray walls is important. It should be flat, as glossy gray is too drab in effect. A ceiling should never be gray. A neutral tint tending towards browns may, however, be glossy in surface; also many walls that are blue but almost gray.

Given a gray background, certain colors at once suggest themselves to work with. Pink—a bluish pink, not an orange pink—is excellent, and very effective. Pale blue may be charming, but it should be a pinkish blue and not a green one if the gray is light. Bright green also is delightful, but brown and yellow are to be avoided as being antipathetic and not sufficient in themseves to quell the gray. Pure vermilion and pure emerald green are beautiful with light gray, but with dark gray they fail, and one must turn to crimson and to richer greens. However, the same bright blues will go with all shades of gray.

White is good with all grays up to a point, but where they are dark the white should be slightly tinted and really be a pale gray. Black is poor with light gray, but good with dark gray, provided it is a blue black and not a brown black, which must only come near the browner tones of neutral tints.

One of the best backgrounds for drawing or for etchings may be had by painting a wall white and then glazing lampblack and gray mixed and stippled. The result should be dark and varnished, and with it may be bright colored or white paint with a flat surface, the frames of the pictures being the same color as the doors, etc.

Gray curtains, cushions, etc., need care. Gray carpets need no care, and can be, and are, put in everywhere where nothing else is called for.

If gray curtains there be they must be of silk or other expensive material. Cotton should be avoided. Gray curtains are better self-colored, and should not have a colored design on them. Their beauty should be in their oyster-like gloss. Also gray cushions should be self-colored. Gray should never be floridly decorated, and therefore all "extras" should not be done in gray.

Fringes and braids of gray can be very good, and they may be made of very fine silk or artificial silk to give a gloss that will make them represent silver.

Unpainted woodwork can be gray and be very lovely. The wood may be bleached by a polisher and then left. It is better unwaxed, but if it be waxed, then white wax should be used, as one wishes to keep it as silvery as possible.

Gray floors are always effective. This can be done and sustained with oxalic acid, but such bleaching is useless for furniture that is used much, as grease and oils destroy the bleach.

Outside, gray paint is of little value; white is usually far more serviceable. Gray blinds on a white house with a gray tiled roof are pleasing, and a very highly varnished front door is smart in a white archway and is charming.

Silver light fixtures and candle holders also blend beautifully with gray. Gray paper for a bathroom is delightful.

"ANTI-HYDRO" Keeps a River Out of This Power House

The concrete foundations of this building are below the water level of the river that flows beside it. Nevertheless, the basement and boiler room are always dry, because the concrete is **permanently** water-proofed with "ANTI-HYDRO."

"ANTI-HYDRO" is an easy-to-use liquid integral compound that both hardens and waterproofs **in one operation.** It mixes with the gauging water without the aid of skilled labor. It is very economical to use and results are guaranteed permanent.

For 22 years "ANTI-HYDRO" has been repeatedly specified and used by leading architects, engineers and contractors the country over. Use it on **your** next job.

ARMSTRONG CORK HOUSES
AT DEVON, PA.

Six wonderful New England Colonial type houses, surrounded with old shade, and two minutes from Station.

Insulated throughout with Armstrong's Corkboard, 1½″ thickness on all outside walls and 2″ thickness on roof, effecting a fuel saving of at least 30% per heating season. All drafts are eliminated. A cork-lined house is many degrees cooler in summer. This is especially true of the upper floors.

Armstrong's Linoleum and Linotile floors installed.

Sample house is heated and open for inspection daily, 2 to 5 o'clock. Agent at Sample House.

As The Editor Sees It

CONTRACT WORKING TIME AND LIQUIDATED DAMAGES

By W. H. Connell,
Engineering Executive and Acting Secretary of Highways, Commonwealth of Pennsylvania

Time is an essential element of a contract and in order that there be true competitive bidding, the time allowed must be stated in the proposal and understood by all.

The charging of contract time must be considered impartially as the interests of the public and the contractor are involved. The policy of the Department and the method of charging working time in the field, stated briefly, is as follows:

The Department's Form No. 476 is used for indicating the basis upon which the Department has determined the contract working time. This analysis of time and allotment to the various major operations will be considered satisfactory unless the contractor chooses to use a different plan and schedule. If he chooses to do this he shall discuss the matter with the district engineer and obtain his approval and a new Form 476 shall be worked up and used as the basis of operation in checking the contract working time.

Legal time is the correct working time after the legal starting date and is used for determining liquidated damages. The actual time includes any time used previous to the legal starting date plus the legal time and is used for determining the actual progress and cost of the various items.

The district office, upon receipt of a notice of execution of a contract, will notify the contractor to begin operations on a stated date providing he has not done so in the mean time. This date usually is ten days from the date of the letter to the contractor and the charging of working time begins at the time stated in the notice. If the contractor has begun operations, working time is charged from the date of notice-to-proceed given to the contractor.

As the remission of working days or extension of contract time is vested entirely in the Secretary of Highways or his deputy, the inspector is instructed to charge time for every day or fraction of a day with the exception of legal holidays and Sundays, when the weather will permit work on the major controlling operations and he has no alternative. He is instructed to keep an accurate record for all delays and their causes, these being submitted to the district engineer for his consideration.

The controlling major operation may be defined as that operation which controls the progress of the contract at any time. Generally speaking, grading will be considered the major controlling operation until such time as the schedule provides for the starting of the base course or surfacing. If the contractor continues to grade after paving is scheduled to start and weather conditions would not permit paving, no time shall be charged, based upon the consideration that the surfacing operation will require the scheduled amount of time for its completion and is the major controlling operation at that time, regardless of the grading. Very frequently the contractor desires to continue grading operations during the winter months while the grading operation is still the controlling major operation. In this case, time will be charged proportionate to the work accomplished to that scheduled, until such time as the grading operations cease to be the controlling major operation, and from that time on no charge will be made for grading.

In order that the contractor may be fully informed of the time charged on any particular project, the district engi-

neer is instructed to notify him monthly of such charges and request an immediate discussion of any exceptions the contractor desires to take. If the district engineer concurs with the contractor, he will advise him that he will recommend such remissions to the Secretary of Highways for his consideration.

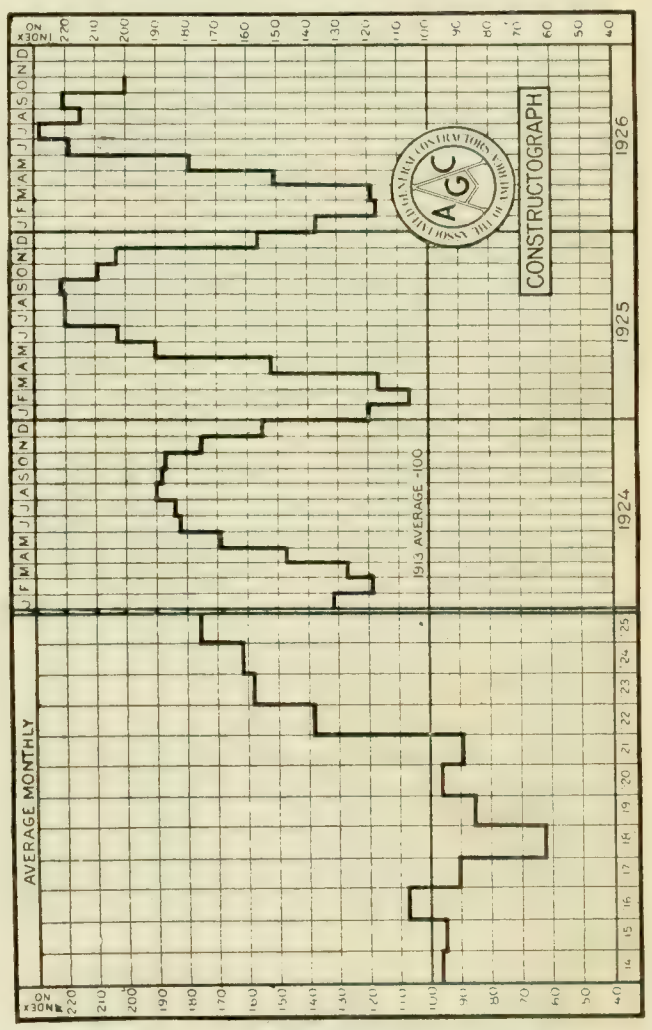
The principal causes for recommending remission of working time are equipment breakdowns, embargoes or failure to obtain delivery of material, delays due to public service companies' failure to remove or relay structures within the limits of the work, and increasing items in the contract. No remissions will be considered for causes other than those over which the contractor has no control, or for which he is not responsible. The contractor is considered responsible for supplying labor and materials and only in extremely exceptional cases, where it is shown that the contractor has used every practical means to meet this requirement and has failed through no fault of his own, will remissions be considered.

Adjustments of contract time for inceased or decreased quantities will be made at the rate of progress indicated in the schedule, or at a satisfactory lower rate of progress according to the conditions, which will be determined by the engineer.

Failure to anticipate conditions and to complete minor operations which delay any controlling major operations will be considered the contractor's responsibility.

The district engineer's recommendations will be considered by the Secretary of Highways each month providing the remission recommended amounts to at least 10 per cent. of the original time allowed in the contract.

When operations are discontinued during the winter months, the district engineer is instructed to notify the contractor in the spring that operations must be begun on a given date and time will be charged from that date and carried along in the same manner as on a contract just executed, providing however, the contractor has not begun a controlling operation before the given date, when in such cases time shall be charged from the beginning of such operation. Reasonable time for closing down work in the fall and resuming in the spring will be allowed without charging time.



Liquidated damages are provided in the contract and are assessed for two reasons: First, the expense and inconvenience to the public for the failure of the contractor to complete the work for the use of the traveling public; and, second, the expense of administration for overhead and inspection during the extra time used by the contractor.

The district engineer may recommend that after the pavement is opened for traffic and after the contract time has all been used, all time charged thereafter may be remitted with the exception of the equivalent of the inspectional charges. If such recommendations are approved the charge shall be the actual inspectional charges during such period, based on calendar days regardless of working days that were consumed.

If any special cases arise that are not covered by the above conditions the district engineer is instructed to submit the facts to the main office for decision.

More than 7 billion dollars already have been spent this year for construction in the United States. The volume of building operations financed by this enormous expenditure during the first ten months of 1926 is greater than the volume registered during the corresponding period of last year, when all previous records were broken, according to statistics compiled by the Associated General Contractors of America.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 27, 1926. Sealed Proposals will be opened in this office at 3 P. M., November 23, 1926, for the construction of a brick-faced, stone-trimmed Post Office Building of approximately 6,850 square feet ground area at Montclair, N. J. Drawings and specifications may be obtained from the Custodian of the site at Montclair, N. J., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(*Continued from Page* 712)

Despite a decrease of 10 percent. from the September volume as noted last month, the total for the first ten months of 1926 stands 1½ per cent. above the corresponding 1925 figure.

The amount of construction work handled during October was exactly twice the figure registered as the monthly average in 1913.

A study of the statistics shows that no decrease in the volume of construction has extended through more than one month. This fact is being viewed as remarkable in view of the high peak figure set last July when all records for a single month were broken. Following a decrease in August, operations again increased in volume in September.

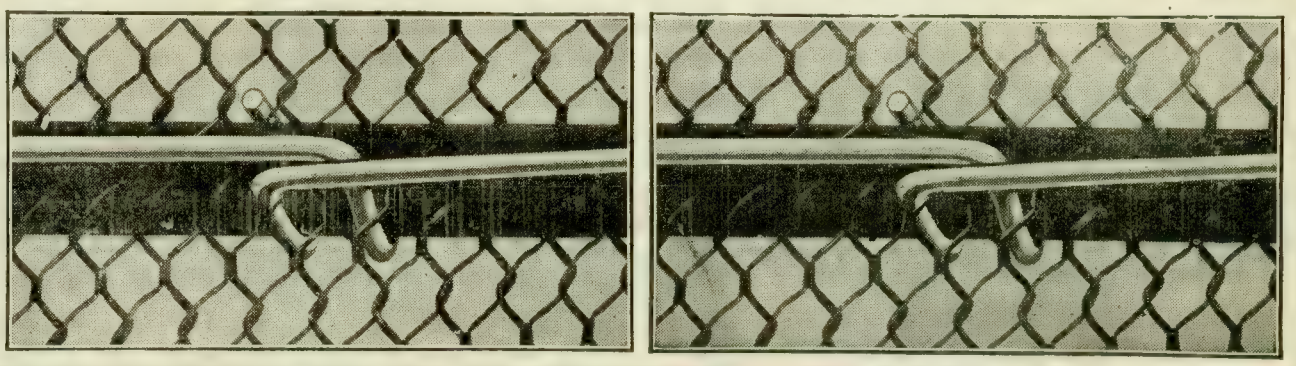
October operations stand at the 200 point mark on a scale which places the 1913 monthly average on the 100 point basis. The average for 1925 was 176.

THE FIRST CONSOLIDATED EDITION OF TWO FAMOUS PURCHASING GUIDES

Hendricks Commercial Register, the pioneer, was in its 34th year when it was absorbed by and consolidated with MacRae's Blue Book, itself a famous, national industrial directory of 16 years' high standing amongst buyers for America's largest and most active industries.

The new, consolidated edition is a compact, substantially bound volume of 2264 pages, measurnig 8½x14x4 inches and weighing only 11 pounds. This is a size that makes the book a convenience, rather than an encumbrance, on the busy buyer's desk.

The Address Section in the forepart of the book consists of an alphabetically arranged list of approximately 75,000 important manufacturers, their home office addresses and, in many instances, the names and addresses of the local distributors for their products.



The Classified Material Section of nearly 1700 pages lists approximately 15,000 different kinds of material, equipment and supplies from Abrasives to Zobos, with the names of prominent manufacturers listed alphabetically beneath each classification.

The Trade Name Section in the back of the book contains the trade-names of approximately 75,000 products together with the manufacturers thereof, thus enabling those who remember only the trade-name of a product to find the manufacturer.

More than 50,000 executives (the majority of those who specify or buy for large industrials, railroads and the government) save hours daily and millions annually through their use of MacRae's & Hendricks.

As a most convenient source of up-to-date buying information as to competitive sources of supply, *a copy in your office will save time and money for you, too!* The price per copy is $12.00. Send your order to Building News Publishing Co., Perry Building, Philadelphia.

FORESTRY NEEDS DISCUSSED BY SECRETARY JARDINE AND CHIEF FORESTER GREELEY

Lack of financial preparedness on the part of the Federal Government was given as one of the causes of the heavy public losses from fires in the National Forests during the past season by Secretary of Agriculture Jardine in an address before a meeting of State Foresters recently held at Washington. "What we need to protect these great public properties," the Secretary continued, "is to have in advance enough money, men, and facilities to prevent fires or to cope with them before they grow large. As it is now we are forced to spend large sums of money after the fires have got out of bounds and then ask Congress to make up the costs through a deficiency appropriation. What we need is the advanced appropriation sufficient to meet the National forest fire problem. And the Federal Government must furthermore discharge the financial obligations it has assumed toward the States under the Clarke-McNary cooperative forestry act."

State rather than Federal activity in forest conservation must be looked to for the main progress in timber growing from now on, W. B. Greeley, Chief of the Forest Service, told the foresters. The Federal forest policy for a good many years to come, he said, was completed with the enactment of the Clarke-McNary Law in 1924, providing for financial co-operation in forest fire control between the Federal Government, the States, and private landowners, and the chief development henceforth should be in the forestry undertakings of States, local institutions, and individuals.

Fifty million acres of forest land should be acquired by the States, counties, and muncipalities, in addition to their present holdings of 11 million acres, said the Chief Forester, and the Federal Government should add 8 or 10 million acres to its present forest area of 89 million acres. "Perhaps the greatest single obstacle to the rapid spread of timber growing in the United States," he continued, "is the unstable ownership of forest land; and it is incumbent upon public agencies to put greater stability into our forest land situation by a vigorous extension of public forest ownership, not only as meeting an urgent problem in land utilization but as offering substantial public returns in the long run. Moreover the more demonstration we can get in all parts of the country of good forest practice and profitable forest management the more will the whole process of reforestation by all agencies be stimulated."

Pennsylvania has bought a great deal of forest land in the last 25 years, according to Major R. Y. Stuart, State Forest Commissioner. The average price paid was $2.26 an acre and this land is worth $10 an acre today. So successfully has State forest ownership and management worked out that a bond issue of $25,000,000 for buying additional forest land will be submitted to the voters of Pennsylvania next year, Major Stuart told the meeting.

Likewise urging that the Government meet these financial obligations for fire control, Colonel Greeley emphasized that the disastrous forest fire season just ended demonstrates that mastery of the fire menace demands not only men and money, but the perfecting of the science and art of fire fighting on a big scale. In spite of the fine progress made both by private, State, and Federal agencies, much remains to be done which requires organized research and a better co-ordination of fire fighting forces than has yet been achieved.

Taking up the theme of forest fire research, Austin F. Hawes, State Forester of Connecticut and newly elected president of the Association of State Foresters, announced that the Weather Bureau expects as soon as sufficient funds are available to assign an expert to the New England States, as it has already assigned them to other forest regions, to study methods of forecasting bad forest-fire weather.

Detailed statistical records are available of a great many thousands of forest fires in various parts of the United States during the past 10 or 15 years. Progress is being made in different forest regions in analyzing and interpreting the statistics, and much light is being thrown from this source on causes of fires, regions of special hazard, the success of different methods of combating them, and on many other aspects of the fire problem.

The various lines of forest fire research conducted by the Forest Service and the Weather Bureau in co-operation with the States and private protective agencies were outlined by Mr. Hawes, S. T. Dana, director of the Northeastern forest experiment station, and by W. R. B. Hine, State Forester of Louisiana.

"The Clarke-McNary Law opens the way for a study of forest fire problems such as we never had before," said Paul G. Redington, Assistant United States Forester in Charge of Public Relations. "It is an opportunity to compare methods and results in different regions and different States for mutual benefit and to work out new methods and principles in forest fire control. Investigations of fire control have been completed in four States by the State and Federal Forest officers acting jointly and the results will soon be made public."

Calling the Clarke-McNary forestry law a piece of neighborly legislation for the benefit of all the owners of forest land in the United States, Mr. Redington asserted the law is peculiarly rich in opportunities for educational contact. "It provides for direct assistance to those engaged in two of the most widespread and important industries—agriculture and lumbering. It is not mandatory but is designed to encourage all those agencies that have a self-interest in keeping our forest lands productive. It provides the elements necessary for a great educational effort—the accumulation of knowledge, the dissemination of this knowledge by direct contact, and the demonstration of good forestry methods.

"It will be the function of the Forest Service to coordinate and, where necessary, to stimulate this educational drive to see that it is nation-wide in character."

The educational work in foresty among farmers provided by the Clarke-McNary law is of the utmost importance to our future timber supply, according to Mr. Redington, because a third of our total forest area is in farms. Likewise the splendid efforts of the States in providing millions of young trees for planting on farms and elsewhere is not only directly beneficial in adding to the timber supply, but has a great educational value.

Carrying Out the Clarke-McNary Law

One of the prime objectives of the Clarke-McNary Law, according to E. O. Siecke, State Forester of Texas, was to build up strong forestry departments in the States. The methods by which Federal appropriations for forest fire control, growing of forest nursery stock, and educational work among farmers are apportioned among the States was fully explained by J. G. Peters, Chief Federal Inspector under the Clarke-McNary Law. "The Federal Government is not beginning to meet its share of fire control under the present cooperative program," said Mr. Peters. "At present it is allotting to the States a little more than $600,000 a year, whereas the States and private owners are spending in excess of four million dollars a year. To meet the Government's share, the present Federal appropriation needs to be raised nearly $1,100,000. Even when it is raised to that amount, however, the total job of fire control will be only about half done. We estimate the total cost of reasonably protecting all the State and private forest lands in this country at about $10,200,000. Under the Clarke-McNary Law, the States and private owners would pay about $7,700,000 and the Federal Government about $2,500,000."

Forest Tax Investigation Under Way

A nation-wide investigation of forest taxation has just been launched by the Department of Agriculture, the work having been initiated by the Forest Service last July in the forest regions of Minnesota. It will soon be extended to

Wisconsin and Michigan and thereafter to the other important forest regions of the United States.

Landowners are carrying a heavy burden of taxation, Secretary Jardine asserted, and one of our most important tax problems is to make sure that they are not forced to carry more than their share, for excessive land taxation discourages the production of crops, whether of food or of timber.

"The forest tax problem," said Dr. Fred R. Fairchild, professor of economics at Yale, in charge of the Government investigation, "is an integral part of the general property tax problem. It can not be isolated from other property taxation and studied alone, but must be studied in its relation to all other forms of the general property tax. Before we can successfully revise local taxation, whether of forest or any other class of land, we must have a thorough understanding of the needs of the local government for roads, schools, and other public purposes as well as of the sources of tax revenue and of the comparative load borne by all classes of property. So our investigation has got to embrace the whole field of property taxation, and if I am not mistaken it will throw light not only on forest taxation but on all phases of property taxation. But we must not expect results too soon. We are trying to develop basic principles of property taxation as applied to growing forests. These principles can not be formulated out of thin air but must be based on a patient, detailed, intensive field study of taxation practice in typical selected counties throughout the country. When we get these principles worked out, however, I feel sure they will be of assistance to the States in framing fair methods of forest taxation."

"A ZONING PRIMER" AND "A STANDARD STATE ZONING ENABLING ACT"

Revised editions of "A Zoning Primer" and "A Standard State Zoning Enabling Act", under which municipalities may adopt zoning regulations," are announced by the Division of Building and Housing of the Department of Commerce. These publications, both by the Advisory Committee on Zoning, appointed by Secretary Hoover, rank among the most popular pamphlets issued by the Department, more than 50,000 copies of each having been sold by the Superintendent of Documents.

The "Primer" explains in popular style the methods by which zoning protects property and health and avoids unnecessary scrapping of serviceable buildings. It was first issued in 1922. "Since that date the number of zoned municipalities in the United States has increased from less than a hundred to more than 450, and the constitutional status of zoning has been upheld in thoroughgoing decisions of the highest courts of such states as New York, Massachusetts, Ohio, Illinois and California. There has been a wealth of added experience in the application of zoning to the most varied problems in many types of cities and villages. The revised edition takes into account the developments of the past four and a half years, and includes a list of zoned municipalities by states.

"A Standard State Zoning Enabling Act" has been embodied in the laws of 20 states since it was first issued in preliminary form three years ago. Court decisions on cases arising under it have been studied with the greatest care, and the only change made in the text is in the section on "Enforcement and Remedies," where the other means of securing compliance with zoning ordinances are strengthened by adding the following:

"The local legislative body may provide by ordinance for the enforcement of this act and of any ordinance or regulation made thereunder. A violation of this act or of such ordinance or regulation is hereby declared to be a misdemeanor, and such local legislative body may provide for the punishment thereof by fine or imprisonment or both. It is also empowered to provide civil penalties for such violation."

Some of the introductory statements have been revised, and, in response to requests, a new foot-note has been drafted on the subject of empowering communities to exercise zoning control over areas which are adjacent to the city's limits but do not lie within any other incorporated city or village.

"A Zoning Primer" records that "on January 1, 1926, the 426 zoned municipalities in the United States had a total of more than 27,000,000 inhabitants, exceeding half the total urban population of the United States. Thus a majority of all people living in incorporated places with 2,500 or more people now enjoy the protection and other benefits of zoning. On January 1, 1921, there were only 35 zoned cities and towns, with less than 11,000,000 population, so that in a period of five years the number of zoned municipalities increased more than twelvefold."

"Undoubtedly the most convincing statement which could be made in regard to the value of zoning is that so many of the large cities of the United States now feel that it is impossible to continue to develop further without the adoption of a building zone plan. New York, Chicago, Boston, Baltimore, Pittsburgh, Los Angeles, Buffalo, and San Francisco, had the list of the large cities that already have zoning ordinances in operation. On January 1, 1926, 48 of the 68 largest cities in the United States, having in 1920 a population of more than 100,000 each, had adopted zoning ordinances, while most of the others had zoning plans in progress. Moreover, it is not alone our larger cities which realize the necessity for timely regulation of the uses of property. Hundreds of the smaller cities and towns, especially in California, Illinois, Massachusetts, New Jersey, New York, Ohio, Pennsylvania, Wisconsin, but also in many other States, have passed zoning ordinances and hundreds more were reported as having zoning plans in progress."

The Advisory Committee is composed of the following men:

Charles B. Ball, Chicago, Ill., Secretary-Treasurer, City Planning Division, American Society of Civil Engineers.

Edward M. Bassett, New York, N. Y., Counsel, Zoning Committee of New York.

Alfred Bettman, Cincinnati, O., Director, National Conference on City Planning.

Irving B. Hiett, Toledo, O., Ex-President, National Association of Real Estate Boards.

John Ihlder, Washington, D. C., Manager, Civic Development Dept. of the Chamber of Commerce of the United States.

Morris Knowles, Pittsburgh, Pa., from the Chamber of Commerce of the United States; Chairman, City Planning Division, American Society of Civil Engineers.

J. Horace McFarland, Harrisburg, Pa., Ex-President, The American Civic Association.

Frederick Law Olmsted, Redondo Beach, Calif., Ex-Pres., The American Society of Landscape Architects; Ex-Pres., American City Planning Institute.

Lawrence Veiller, New York, N. Y., Secretary and Director, The National Housing Association.

John M. Gries, Chief, Division of Building and Housing, Department of Commerce.

Thomas C. Trafford, Builder, formerly of 1613 Sansom St., Philadelphia, has moved his offices to 2335-37-39 N. 15th St., Philadelphia.

Albert F. Schenck, Architect, announces the removal of his office to 301 Harrison Bldg., 4 S. 15th St., Philadelphia.

John Emlen Bullock, Architect, has moved his offices from 34 S. 17th St., Philadelphia, to 142 Allen's Lane, Mt. Airy, Philadelphia.

Harry A. Short Co., Engineering Contractor, Plumbing and Heating, have moved to 1517 Pine St., Philadelphia.

Durham Bros., Architects, formerly of 1611 Sansom St., Philadelphia, have opened new offices at 34 S. 17th St., Philadelphia.

CERTIFICATES OF CRAFTSMANSHIP ISSUED

Philadelphia Building Congress Makes Second Annual Award

At a dinner meeting held recently, in the Poor Richard Club, attended by all elements in the building industry, with many of the recipients present in person, the Philadelphia Building Congress desiring to encourage and to preserve in Philadelphia and its metropolitan area the true spirit of craftsmanship, and to give recognition to those whose skill, patience and toil have builded well in the community, awarded Craftsmanship Certificates to sixty-three individuals and firms, as follows:

Guildsmen—to those engaged in the Crafts, who have shown especial skill in developing the artistry or handicraft possibilities in their particular field of work, such as designing, laying off, modelling, carving, wrought-work, and have given visible evidences of individuality—a Certificate as a Guildsman—was awarded to: James Donnelly, Bricklaying; John Kappes, Bricklaying; Thomas Kelly, Bricklaying; Martin J. Lesler, Bricklaying; John McGowan, Bricklaying; James O'Loughlin, Bricklaying; William Reinhold, Bricklaying; Charles Fanalle, Foremanship in Stone Masonry; James Liberi, Metal Work; Louis Milione, Sculptor; J. H. Bass, Wood Carving; John M. Schaefer, Jr., Wood Carving.

Master Craftsmen—to those who have designed, specified and supervised buildings which have been successfully erected, who have shown knowledge of appropriateness of design with the most advantageous use of materials, who have encouraged pride of craft on the part of co-worker, and have given individual recognition of it when deserved—a Certificate as a Master Craftsman—was awarded to: Mellor, Meigs & Howe, Architecture.

Co-operating Master Craftsmen—to those who have satisfactorily either erected buildings or other structures or parts thereof, or installed equipment therein, and have encouraged pride of craft on the part of co-workers and have given individual recognition of it when deserved—a Certificate as a Co-operating Master Craftsman—was awarded to: Wm. R. Chapman & Sons, Brickwork; Hauser & Green, Brickwork; Hunsperger, Inc., Brickwork; John B. Kelly, Brickwork; Frank S. Stites, Brickwork; M. E. Arnold & Co., Electrical Contracting; Edgar J. Ellis, (posthumous) Electrical Work; Barclay, White & Co., General Contracting; Bowers' Bros. & Co., Heating of Buildings; Edward R. Sabin, Heating of Buildings; E. P. Henry Co., Slate Work; Toll Brothers, Stone Masonry and Brickwork.

Craftsmen—to those, now designated by various names, such as Mechanics, Artisans, Skilled Workers, etc., who in any building Craft have shown skill, ability, efficiency, willingness and the desire to improve their own knowledge and technique as well as that of fellow workers, helpers or apprentices—a Certificate as a Craftsman—was awarded to: Chas. C. Adams, Bricklaying, Alexander Bell, Bricklaying; George Bell, Bricklaying; William Benson, Bricklaying; Watson Burton, Bricklaying; Frank Burkett, Bricklaying; Michael Connolly, Bricklaying; James Francis, Bricklaying; James Goodfellow, Bricklaying; Harry G. Holleran, Brickaying; J. E. Krausse, Brickaying; Max Mau, Bricklaying; Martin Mulkeen, Bricklaying; Thos. Slater, Sr., Bricklaying; Warren Zearfoss, Bricklaying; John H. Tegler, Electrician; Joseph Dold, Foremanship in Bldg. Construction; Albert J. Schaefer, Foremanship in Building Construction; Domenico Vecere, Foremanship in Building Construction; William Blair, Heating of Buildings; Louis Bodo, Iron Work; Joseph W. Keller, Iron Work; I. T. Worthley, Iron Work; Harvey Biesicker, Lathing; Joseph Amey, Master Mechanic; Harry Clegg, Master Mechanic; G. Donato, Modeling; E. H. Clevenger, Mural Decorating; L. M. Gilbert, Plastering; Frank DeGuieseppe, Scagliola Work; Maggs Bros., Slate Roofing; Joseph McVaugh, Stone Masonry; J. P. Mollencoff, Supt. of Plastering.

Junior Craftsmen—to those, now designated as Apprentices, Learners, etc., who, after satisfactory completion of such terms as shall be deemed sufficient, indicate the characteristics described in the paragraph relating to Craftsmen—a Certificate as a Junior Craftsman—was awarded to: Albert McMullin, Apprentice in Plastering; Edmond F. Venzie, Apprentice in Plastering; John Connelly, Bricklaying; Michael Connors, Bricklaying; Albert C. Shieling, Bricklaying.

D. Knickerbacker Boyd, Architect, President of the Congress, was the presiding officer, and inspiring addresses were given by Paul A. Davis, President and C. C. Zantzinger, Vice President, Philadelphia Chapter American Institute of Architects, Mr. L. F. MacNeill, Philadelphia Building Chapter, Associated Pennsylvania Constructors, Mr. Ransom C. Gaskill, Atlantic City Brotherhood of Carpenters and Joiners, Thomas F. Armstrong, Builders' Exchange and Employers' Association, John D. Cassel, Superintendent of Buildings, Board of Public Education, Frank Bowden, Bricklayers' Union No. 1, Robert E. Lamb, Builder, and others; after which the Certificates were distributed with most appropriate remarks by John Irwin Bright, Chairman of the Committee on Awards. A feature of the presentation was the appearance in person of the employers of many of the craftsmen and their remarks in eulogy of the workmanship done by the men who were so signally honored.

Secretary C. M. Little read telegrams and letters of congratulations and commendation and wishing the recipients continued success from R. H. Shreve, President, New York Building Congress—W. Stanley Parker, President, Boston Building Congress—F. U. Murphy, President, Oregon Building Congress—Dwight L. Hoopingarner, Executive, American Construction Council—Wm. O. Ludlow, Chairman, Craftsmanship Committee, New York Congress, and from the Presidents of the Philadelphia Chamber of Commerce, the Real Estate Board and other organizations.

Building operations during the winter promise to gain a volume unusual for that period of the year. By so doing, they will place this year's construction activities on a new record level above that established in 1925, according to statistics developed by the Associated General Contractors of America.

Mainly, the outlook for these unusual winter activities is based upon the fact that a vast amount of building contracts recently have been awarded. The volume of these awards in September was 6 per cent. greater than the total registered during the corresponding month of last year.

In addition, significance is being attached to the fact that the volume of contracts awarded during the first nine months of this year is 9 per cent. greater than the figure set by the first nine months of 1925, while the volume of construction actually undertaken during the first 10 months of 1926 is only 1½ per cent. greater than the corresponding total for last year. This combination of facts is being accepted as indicating that a large amount of awards soon are to be translated into terms of actual operations.

The index number for volume of contracts awarded, based on the 1913 average as 100, stands at 244 for September. This follows the peak figure of 264 for August which broke all previous single-month records for award of contracts. In only two months during 1925 and 1926 has the mark for volume of contracts awarded reached a plane higher than that which it gained in September.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

The impractical dreamers are not the architects, but the clients themselves, as a rule.

Indemnity Insurance Company of North America write practically every form of Insurance, except life

"ANTI-HYDRO" Keeps a River Out of This Power House

The concrete foundations of this building are below the water level of the river that flows beside it. Nevertheless, the basement and boiler room are always dry, because the concrete is **permanently** water-proofed with "ANTI-HYDRO."

"ANTI-HYDRO" is an easy-to-use liquid integral compound that both **hardens and waterproofs in one operation.** It mixes with the gauging water without the aid of skilled labor. It is very economical to use and results are guaranteed permanent.

For 22 years "ANTI-HYDRO" has been repeatedly specified and used by leading architects, engineers and contractors the country over. Use it on **your** next job.

ARMSTRONG CORK HOUSES
AT DEVON, PA.

Six wonderful New England Colonial type houses, surrounded with old shade, and two minutes from Station.

Insulated throughout with Armstrong's Corkboard, 1½″ thickness on all outside walls and 2″ thickness on roof, effecting a fuel saving of at least 30% per heating season. All drafts are eliminated. A cork-lined house is many degrees cooler in summer. This is especially true of the upper floors.

Armstrong's Linoleum and Linotile floors installed.

Sample house is heated and open for inspection daily, 2 to 5 o'clock. Agent at Sample House.

As The Editor Sees It

INSULATED HOUSES

BY JOHN R. LIVEZEY

In previous articles I have gone into details, in a general way, on house insulation, and the benefits derived, and serious attention is being given to this important matter on account of increasing cost of fuel and a desire for a greater degree of comfort.

It cannot be questioned that a man or woman who sets out now to build or buy a house knows, far more than ever before, what they want and how to get it. It is therefore more than ever necessary that the architect, contractor and builder be thoroughly familiar with every detail of the best house insulation so that he can satisfy his clients and take full advantage of the economies effected by proper insulation such as smaller heating plant, elimination of lath, etc.

Nothing is more certain than that the well built house of the future will be adequately insulated and that the uninsulated one will soon be classed with the "undesirables." It is more to the advantage of the architect and builder to be up-to-date than behind the times.

Insulation is not a luxury; on the contrary it is very reasonable in cost and adequate insulation is well worth while, within the limits of every house that is worth planning and building well, no matter what the cost.

If heat were visible, we could watch it on a winter day, pouring out through the walls and rising through the roof and there would be no question in anyone's mind that such waste should be stopped.

Heat is invisible, but the loss can be accurately calculated from known factors based on test results. and it has been established that 55% of the total heat supplied by the furnace passes off thru the walls and roof of the average home, the other 45% being dissipated unavoidably in air change and from door and window surfaces. Of twenty tons of coal burned, the heat from eleven tons is lost in this way through the construction. Under such conditions, it is necessary that a much larger heating plant and considerably more fuel are required than would be needed if this 55% loss could be materially reduced.

The average heating plant is figured for a house of uninsulated construction from which, as said above, 55% of the heat is lost through the walls and roof, but an adequate thickness of corkboard on the walls and roof lessens that loss by about 60%—a net saving of about a third (60% of 55% equals 33%). Obviously, if less heat is lost, less is needed and it is perfectly safe and practical to install a smaller heating plant and guarantee results, and this is substantiated by many people who have built and properly insulated.

Pure corkboard has been proven the best commercial insulator for more than twenty-five years; it is granulated cork baked under pressure and the granules are cemented together with their own natural gum; it contains no foreign binder and comes from the moulds in sheets 12 inches wide and 32 inches and 36 inches long, of various thicknesses, suitable for the use it is to be put to, but for house or building insulation, experience and tests recommend for the wall 1½ inches and for roof or ceiling 2 inches. To use less, except where conditions may require a slight reduction, is to lose much of the benefit designed to afford the home-builder the maximum value for the lowest practical cost.

This material has structural strength and will stay permanently in place without cracking, buckling or settling.

It is a wonderful base for plaster; it is non-absorbent and will not mould or decay; it is slow-burning and difficult to

ignite or carry fire; it is also vermin-proof.

With an insulation like this, a house can be uniformly heated; no cold sides, no drafts and no marked difference between up and downstairs—the whole house is comfortable.

The corklined house stays warm over night; the insulation holds the heat. The heating of such a house is very rapid.

Corkboard is of cellular structure, and being non-absorbent, walls where it is used will be perfectly dry.

On the other hand, a cork-lined house will be much cooler, but not damp, in the summer time.

The use of corkboard in apartment house construction would increase the renting values in many ways—by insulating the roof or top floors, these apartments can be easily rented, being warm in winter and cool in summer.

By its use, flat roof construction can be used, eliminating loft space.

Partitions and floors can be insulated with it and they will be sound-proof; it can also be used to insulate the first floor apartments over hot boiler rooms and cellars, and thus remove this objection found in so many apartment houses and hotels.

From all the data and experience obtained by one who has been in close touch with insulation for all purposes for the last twenty-five years, the problem of house insulation is most interesting, and based on such experience, I do not hesitate to recommend corkboard insulation, when properly applied and of suitable thickness, as the best investment that can be added and which will show a good return every heating season.

FIRST TENTATIVE DRAFTS OF UNIFORM MECHANICS' LIEN ACT DISTRIBUTED FOR PURPOSE OF OBTAINING COMMENTS AND SUGGESTIONS

The committee of thirteen men appointed by Secretary of Commerce Herbert Hoover to draw up a mechanics' lien act to serve as a basis for more uniform state legislation on this subject, today mailed out copies of its first tentative draft to several hundred trade associations, labor organizations and individuals who have expressed an interest in the subject.

Existing mechanics' lien laws of the different states, as applied to building construction, aim to provide a procedure by which contractors, sub-contractors, materialmen, laborers, and others, if they are not paid promptly may obtain some extra protection beyond their usual right to bring personal action against the owner, contractor and subcontractor who may have employed them. Under these laws the property and improvements afford security for the debts of those who have contributed to the improvement. To perfect a lien on the property each claimant is required to file for public record a statement of the amount due him.

If an owner fails to make payments as required by his building contract the property may be sold and payments made from the proceeds. If the contractor defaults or goes into bankruptcy leaving obligations due workers, materialmen or subcontractors, they have a claim on the property. On projects carried to completion the total amount of liens is usually limited to the unpaid balance of the contract price of the work and where the improvement is not completed the total of liens is limited to the unpaid balance of the amount earned by the contractor for the work performed. If the claims are not satisfied by the owner a sale of the property may be compelled by court action.

This study was undertaken at the request of several national organizations interested in the construction industries, and the committee is composed of men representing the principal groups whose interests are affected by such laws, including whose interests are those of the owner.

The tentative draft contains few new departures, practically all of its provisions having been found workable in several jurisdictions. The aim of the committee has been to produce an act which will adequately protect the interests of the worker and others concerned in construction as well as the interests of the owner and those who finance building operations, and to distribute as equitably as possible among the groups the burden of securing such protection.

The tentative draft of the act is being distributed to individuals and to trade and professional bodies who will study it in detail and submit to the committee their comments and suggestions. The committee has requested that all comments be forwarded to its secretary before January 31, 1927. They will then be collated and carefully studied by the committee with a view to perfecting the act.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class Every copy reaches a live prospect.

New Jersey Contracts Awarded

Warehouse, Atlantic avenue, Atlantic City, N. J. Architect, D. A. Rosenstein, Humphry Building, Atlantic City, N. J. Owners, Custer & Kallas, Mt. Vernon and Atlantic avenues, Atlantic City, N. J. Fireproof (semi), 3 stories, 85x30 feet, slag roof, concrete and pine floors, electric lighting. Contract awarded to Pedrick & Son, 1415 Atlantic avenue, Atlantic City.

Stores (19), Apartments (22), West Atlantic City, N. J. Architect, A. L. Brooks, Humphry Building, Atlantic City, N. J. Owner, B. R. Fox, 1102 Atlantic avenue, Atlantic City, N. J. Hollow tile, frame, stucco, 2 stories, 550x100 feet, slag roof, hardwood floors, hot water heat, electric light, tile and marble, plate glass, metal skylights. Contract awarded to Wilbert Beaumont, 1 South Tennessee avenue, Atlantic City, N. J.

Parochial School, Pleasantville, N. J. Architect, A. F. Ainodio, Segal Building, Atlantic City, N. J. Owners, St. Peter's Roman Catholic Church, Rev. Dr. F. J. McCallion, Pleasantville, N. J. Brick, 2 stories, 60x100 feet, hardwood and composition floors, steam heat, electric light. Plans in progress. Contract awarded to Walter Meaghers, Pleasantville, N. J.

Residence (alts. and add.), Island Heights, N. J., $4,000. Architect, J. Fletcher Street, 1120 Locust street, Philadelphia. Owner, E. Swift Newton, Island Heights, N. J. General alterations. Contract awarded Thomas H. Wallace, Island Heights, N. J.

Pipe Shed, Camden, N. J. Architect, Frank E. Hahn, Seventh and Chestnut streets, Philadelphia. Owners, Keystone Supply Mfg. Co., 927 North Ninth street, Philadelphia. Corrugated iron, steel, 1 story and basement, 96x100 feet (plumbing, heating, electric reserved), slag roof, cement floors, mill work, concrete work, hardware, metal weather strip. Contract awarded F. M. Harris Co., 1520 Parrish street, Philadelphia.

Highway Work, New Jersey, $306,047.55. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Routes 2, 3 and 6, Delaware River Bridge approaches, Camden County. Contract awarded to Union Paving Co., Thirtieth and Locust streets, Philadelphia.

Miscellaneous Construction News

Municipal Office Building, Holliday and Lexington and Guilford, Baltimore, Md. Architect, William H. Emory, 18 East Lexington avenue, Baltimore, Md. Owners, Mayor and City Council, Baltimore, Md. Low bidders: J. Henry Miller, Inc., Baltimore, Md., $1,498,000; M. A. Long, Baltimore, Md., $1,521,465.

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

Miscellaneous Contracts Awarded

Mill, Greensboro, N. C. Architect, private plans. Owners, Carolina Silk Products Corp., Greensboro, N. C. Brick, steel, 2 stories and basement, 100x200 feet, slag roof, cement floors, steam heat, electric light, rolled steel sash and sprinkler system. Contract awarded William F. Lotz, Frankford avenue and Oxford street, Philadelphia, who are taking subbids.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., October 27, 1926. Sealed Proposals will be opened in this office at 3 P. M., November 23, 1926, for the construction of a brick-faced, stone-trimmed Post Office Building of approximately 6,850 square feet ground area at Montclair, N. J. Drawings and specifications may be obtained from the Custodian of the site at Montclair, N. J., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 728)

The committee believes that a wide and thorough study will aid in producing an act which will be fair and just to all and which can be recommended to each state legislature for consideration.

The committee also believes that uniformity in this field would eliminate much confusion and expense which those doing business in more than one state experience on account of the wide divergencies in the present laws.

The committee's membership is as follows:

F. Highland Burns, Baltimore, Md., Pres., Maryland Casualty Company.

William F. Chew, Baltimore, Md., Ex-Pres., National Association of Builders' Exchanges.

H. E. Essley, New York, N. Y., Associated General Contractors.

George F. Hedrick, Lafayette, Ind., Vice-Pres., Building Trades' Department, American Federation of Labor.

Charles V. Imlay, Washington, D. C., National Conference of Commissioners on Uniform State Laws.

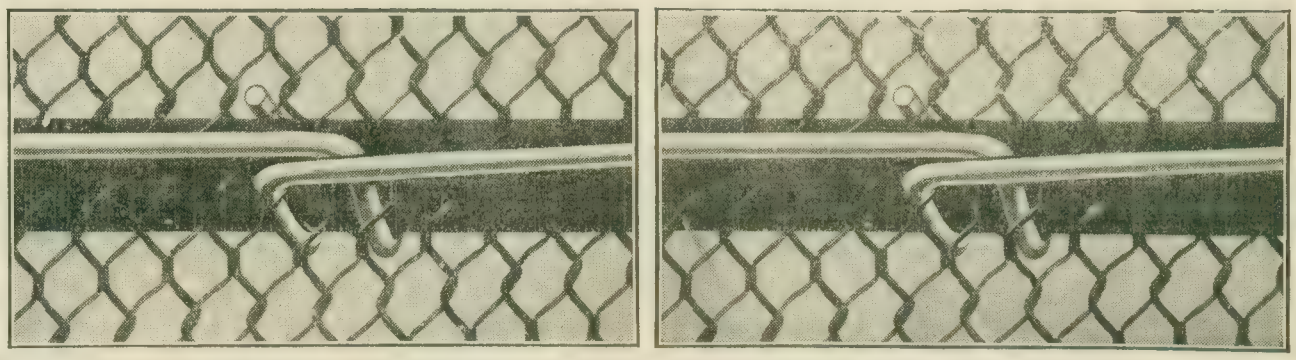
C. Clinton James, Washington, D. C., Pres., U. S. League of Local Building and Loan Associations.

Stewart A. Jellett, Philadelphia, Pa., Ex-Pres., Heating and Piping Contractors' National Association.

William B. King, Washington, D. C., Counsel, National Association of Builders' Exchanges.

Victor Mindeleff, Washington, D. C., American Institute of Architects.

Charles H. Paul, Dayton, O., American Engineering Counsel.



W. D. Rossiter, Cleveland, O., Ex-President, National Builders' Supply Association.

E. W. Shepard, New York, N. Y., National Association of Credit Men.

Frank Day Smith, Detroit, Mich., National Retail Lumber Dealers' Association.

Dan H. Wheeler, Secretary, Division of Building and Housing, Department of Commerce.

BUILDING PERMITS

Permits were granted during September for the construction or alteration of 4,355 buildings at an estimated cost of $17,003,731, according to reports received at the Department of Labor and Industry from 39 Pennsylvania cities and boroughs.

Comparable data for September, 1925, are available for 20 cities. These show that the volume of construction for September, 1925, was $19,808,015, and for September, 1926, it was $15,450,368, or a decrease for September, 1926, of 28 per cent. Sixty-two per cent. of this $4,357,000 decrease of building volume in the total for 20 cities was due to the loss reported for the city of Pittsburgh which, from a total of $4,385,132 in September, 1925, dropped to $1,843,936 in September, 1926, a reduction of $2,680,000, or more than 145 per cent. Other cities that show greatly reduced building operations are Allentown, Erie, Harrisburg, Lancaster, New Castle, Reading, and Uniontown. Philadelphia reported a slight gain for September over last year and in view of the tremendous reductions in Pittsburgh and other larger cities of the State the September report for Philadelphia is remarkable. Of the 12 cities that show increased building over September, 1925, Altoona, Bethlehem, Bradford, and Meadville show the largest percentage gains.

Building projects undertaken in 20 cities for the first 9 months of 1926 are 15,101 less in number and $49,293,898 less in value than for the corresponding months in 1925. This drop in building construction of 22 per cent. was scattered generally throughout the State. But four cities, Allentown, Bradford, Wilkes-Barre, and Williamsport, can show that the total value of permits issued during 1926, exceed the volume of construction for the corresponding 9 months of 1925, and even the gains for these cities are small.

Comparative Total	3,868	$15,450,368	4,068	$19,808,015

*Not included in comparative totals.

Construction costs decreased slightly during October, giving emphasis to a gradual downward tendency they have been observing during the past three years. The decrease last month was due to a slight lowering of the average of wages in the building trades and to a decline in the average of prices paid by contractors for building materials, according to statistics compiled by the Associated General Contractors of America.

Since May, 1923, construction costs have been moving slowly but consistently toward lower levels. Mainly this has been the result of a very apparent drop in the prices of the principal building materials. The effect of these reduced prices upon the ultimate costs of construction has been somewhat offset by the tendency of wages to hold to levels high above those they occupied at the beginning of 1923.

A study of the changes in the average of wages since May, 1923, shows 10 increases and 4 decreases, with a net increase of 12 points from 213 to the present figure of 225 on a scale which has the 1913 average as its basis for 100. A study of the monthly changes in the average of prices paid for building materials covering the same period shows 8 increases and 18 decreases, with a net drop of 28 points from 203 to the present mark of 175.

The average of construction costs in the principal building centers of the United States now rests at index number 195, 10 decreases since May, 1923, having offset 8 increases during that period to bring the figure down 7 points within three and one half years.

Ceresit Waterproofing Corporation, 512-14 South Canal Street, Chicago, announce that they are represented in the Philadelphia territory by the Philadelphia Building Materials Co., John F. Dakin, 1209-11 North Taney Street.

Ceresit Waterproofing, Dampproofing and Protective Products are carried in Philadelphia stock, insuring immediate delivery.

Rapid conclusion of a five-year old legal wrangle involving eighty-five million dollars, based upon cost of construction of army cantonments during the World War, is being discussed here as a probability. Suits brought by the Department of Justice several years ago against the builders of eleven of the "cities" which housed the national army are threatened with collapse as a result of a decision brought against the government in a "key case" before the United States District Court at Richmond, Virginia.

Attorneys who took part in the trial at Richmond, which lasted three weeks, now are reviewing details of the defeat sustained by the Department of Justice in its suit against Rinehart and Dennis, Inc., contracting firm of Charlottesville, Virginia, builders of Camp Lee. The jury returned a verdict against the government within three minutes after receiving the case last week.

It is this decision, said to be the speediest ever given in a case of such magnitude, which is likely to bring about the collapse of similar cases based upon alleged excessive expenditures in construction of ten other cantonments under the "cost plus" system. The government's contentions in all these cases are virtually the same and the opinion is being expressed that the Department of Justice hardly will be able to move in the face of its thorough defeat at Richmond.

High officials of the government under the wartime administration testified during the course of the Rinehart and Dennis trial, including former Secretary of War Newton D. Baker and Brig. Gen. R. C. Marshall, Jr., chief of the construction division of the army during the war.

Returning to Washington today, Gen. Marshall declared the Richmond decision to be "the death-knell of efforts to discredit a major war-time activity of the government."

"These efforts," he declared, "which had their first incentive in political expediency are now, these several years after they were begun, merely furnishing jobs for Department of Justice 'experts.'

"The attempt to indict not only an entire industry but also thousands of government officers, engineers, accountants, workmen and others who participated in provisions of quarters for the draft army in less than ninety days was too ridiculous from the start to have been the product of good faith and an effort at justice.

"Originally, the government had intended to bring suit against the Rinehart and Dennis firm on the basis of fraud. But, after expenditure of hundreds of thousands of dollars in investigations covering several years, the attorneys from the Department of Justice demonstrated the weakness of their position by pressing action simply on the ground of 'wastefulness.' Even after diluting their case to this extent, they found the jury returning almost instantaneously with a judgment against them.

"If the representatives of the Department of justice should decide to fly in the face of the Richmond decision and press virtually identical cases involving construction of other cantonments, they will obtain nothing but complete exoneration of those who are named in the suits."

AMERICA TRAINS BUILDERS FOR RECONSTRUCTION WORK ABROAD

The trade of carpentry has always been one of the highly honored professions in the Holy Land. Nineteen hundred years ago a humble carpenter's shop in Nazareth became the training school for a great religious leader who spread new lustre upon the craft.

Carpentry still holds its prestige in the Neareastern countries, as is indicated in a recent report from Miss Agnes Evon, educational director of the Near East Relief in Palestine. While the site of the original House of the Carpenter in Nazareth has become a traditional shrine, visited by thousands of pilgrims annually, there is something remarkably appropriate in her statement that only a stone's throw away, American philanthrophy has established a training school for carpenters.

Just across a narrow street from the spot in Nazareth where tradition says St. Joseph taught the young Jesus the use of the saw and the plane, 200 orphaned children are being instructed in the business of building. In a trade school operated without thought of worldly gain, these children are learning from the Near East Relief the art of constructing the homes so needed in Palestine and Syria, themselves torn by war, and overflowing with refugees.

In Russian Armenia still other orphans are being instructed to help themselves in the preparing of new homes. Near Alexandropol a model village has been constructed by the young builders, who have learned their trade in the largest orphanage in the world. Such model villages will multiply until, rising under the diligence and skill of youthful artisans, they will dot the whole Armenian countryside.

Greece, too, is the scene of schooling in the building of homes, with America for inspiration and practical guidance.

In a building boom embracing all the Neareastern lands, under the leadership or encouragement of the Near East Relief, more than 100,000 homes are being built or rebuilt by refugees in Palestine, in Syria, in Armenia, in Greece.

The national life of Greece was all but overturned during the war by the influx of a horde of refugees. After the disaster at Smyrna, a million more flocked to her crowded shores. In all, nearly two millions of them sought refuge in this land of remarkable hospitality. Within the past year 60,000 houses have been erected by and for these refugees; 83,000 families have been grouped in 1220 villages upon two million acres allotted to them in Macedonia. Under the guidance of the League of Nations, 26,000 additional houses are to be built during the coming year.

Observers see a genuine, if subtle, peace movement in the building boom in the Levant. It connotes a growth of confidence where confidence has been unknown, and a victory over fear where fear has long been victor. Peace is in the air, for the real builder is too busy to think of war.

America has done much in the Near East. As much more remains to be done. Lest it be forgotten that aid is yet vital to the Near East, Americans are asked again to observe Golden Rule Sunday, sponsored by President Coolidge, and this year set for December 6. On that day they are asked to put themselves in the places of the homeless and parentless children in American orphanages and to limit their fare to a simple ration of bread and stew.

R. B. Wenner, formerly of 2313 Walnut street, Philadelphia, announces the removal of his offices and garage to larger quarters, 2819 W. Gordon St., Philadelphia.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

We'll *write* your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

America stands supreme in the development and use of advertising, and advertising is the seed which by implanting desire produces the fruit of social advancement. Education promotes efficiency and efficiency in turn makes possible higher earning power, higher purchasing power and improved living conditions.

"The Oldest American Fire and Marine Insurance Company"

When you go to a North America agent for insurance, all you pay are the premiums. His service costs you nothing. It includes complete information on the various forms of insurance protection, practical advice on the best policies for your purposes, and inspection of your property and business risks as often as you wish it.

Consult your agent as you would your lawyer or doctor.

"ANTI-HYDRO" Keeps this Huge Warehouse Dry

UNIT C, ARMY SUPPLY DEPOT, CHICAGO, ILL.
S. Scott Joy, *Architect.* E. W. Sproul Company, *Contractors.*

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent.* Twenty-two years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through,* instead of a thin surface coating.

Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

ARMSTRONG CORK HOUSES
AT DEVON, PA.

Six wonderful New England Colonial type houses, surrounded with old shade, and two minutes from Station.

Insulated throughout with Armstrong's Corkboard, 1½″ thickness on all outside walls and 2″ thickness on roof, effecting a fuel saving of at least 30% per heating season. All drafts are eliminated. A cork-lined house is many degrees cooler in summer. This is especially true of the upper floors.

Armstrong's Linoleum and Linotile floors installed.

Sample house is heated and open for inspection daily, 2 to 5 o'clock. Agent at Sample House.

As The Editor Sees It

FIFTH ANNUAL MESSAGE*

By HON. FRANKLIN D. ROOSEVELT, *Pres., American Construction Council*

Since the organization of the American Construction Council in 1922 by Secretary Hoover and myself upon the urgent request of financial, manufacturing, construction and other representative business interests of the country, the Council has done a splendid service in dealing with the economic problems of the construction industry and their relations to the public.

The past four years have witnessed both in volume and in character of operations an unparalleled period of activity for the construction industry, which has required the utmost effort on the part of the industry itself as well as given untold stimulation to the general business structure of the country. This situation brought with it many new conditions and many new influences. Some of these were good; some of them were not good. In the great onrush of a nationwide demand for housing and business buildings, highways and other kinds of construction, sought at almost any price and wanted without delay, it was often difficult for the buying public to single out for itself what was good and what was bad, and successfully meet the situation.

As the Council early pointed out in this period of hectic building activity it was inevitable that enormous loss must result through the putting up of structures of inferior quality and unsound financing. Badly conceived buildings, badly built buildings, and badly financed buildings were often the usual rather than the unusual occurrence. This situation resulted, as the Council was also quick to point out at the time, from the activities of irresponsible groups found in every element of the industry and especially on the part of fly-by-night speculators who came into the industry to pluck what they could and unload on the unsuspecting public. As a consequence, the responsible parties in the various elements of the industry, and I wish to say that there is just as large a proportion of responsible persons in the construction industry as are to be found in any other great and complex industry of the nation, had almost insuperable handicaps to overcome in gaining the recognition they deserved for the proper conduct of the industry and the protection of the public.

In this ominous situation the American Construction Council stood pre-eminent in giving voice and leadership to the construction industry and in awakening the public to the seriousness of the situation, directing its energies toward eradicating the irrsponsible and evil elements and to building up confidence in the responsible and the good.

This was not an easy job and it required time to show the real results. Some persons, truly interested in the same ends, did not pause long enough to analyze what the American Construction Council was doing and for that reason we did not have in the earlier period the full measure of co-operation from many legitimately engaged in the industry who should have supported this worthy movement, that would otherwise have been forthcoming at that time.

But the Council strong in faith and courage, kept hammering away using the weapon of continuous publicity directed toward an informed public opinion—an intangible and seemingly slow but in the final analysis the most powerful force in creating in the minds of the building buying public an attitude receptive to

*Presented by Dwight L. Hoopingarner, Executive of the Council.

those who had honest wares or service to offer.

Today we can view the results of that labor, and they are good. I confidently believe that the American Construction Council has saved the country literally millions and millions of dollars in its work on better building alone. No other organization, speaking for a great industry, even with financial resources many times greater than ours have been, has ever done a more effective job of creating an honest and enlightened public opinion on a subject of such immense importance to the nation.

Of course this has not been done by the Council without the co-operation of many others, for the Council has enjoyed the hearty support of representative groups from all the component parts of the industry as well as of federal and state departments interested in these problems. But the task is not yet done, although the return to a more normal consideration of real building values which has been brought about through the Council's efforts and the general catching up in some lines of building activity is now helping to bring the solution nearer.

You will have brought before you during the sessions of this convention, and you will participate in the conferences on them some of the outstanding problems that still confront us. Among these are the permanency of building construction, the importance of craftsmanship, the relation of building financing to the public good, the need of properly directed city and town planning, and ways and means of securing quality building materials. The speakers on these topics are authorities in their lines and I will not endeavor to elaborate at length on these particular matters.

I wish however to call particular attention to the real emergencies that have resulted from the mushroom growth of many of the country's larger cities without definite and constructive planning. We must build cities and towns, but the time has come when we must build them intelligently. To do this, future needs as well as present conditions must be considered. The health and convenience of the public as well as property values and economy of time are suffering from the lack of well directed building programs in many metropolitan areas. This problem is not confined alone to larger centers but affects every town and village, and intelligent planning on their behalf now will prevent in the future for them the unfortunate conditions that are now causing untold waste in our larger cities either through the continuance of bad conditions or the cost of rebuilding. The undirected mushroom growth of our cities and towns must be controlled. Considerable work along these lines is being done in some localities, but the problem as a whole must be broadly and courageously faced.

There is another problem which merits special attention at this time. As a phase of the general problem of better building. the American public should exercise caution as to what kind of materials it uses in building and be sure that the manufacturers are reliable and of established reputation and, of course, as a matter of patriotism American products should be given preference.

The Council, of course, has been active along other lines than those indicated above. It has, for example, assisted in the general movement for reducing construction peaks and depressions by educating owners and the public to its advantages and co-operating with the Department of Commerce to bring about the coordination within the industry and its related groups necessary to gain the desired correctives. It provides a common and impartial meeting ground for the entire industry and the public to discuss problems of mutual interest in a manner impossible under any other agency. Certain research programs of great importance, as the one having to do with materials and methods of apprentice training, are organized and ready to go forward as soon as the necessary funds are available. These and other matters of vital interest to the public and the construction industry nationally are receiving attention.

It is also a pleasure to report the appointment of Edwin Baxter, Vice-President of the Cleveland Trust Company, as Regional Chairman of the American Construction Council for the Cleveland Federal Reserve Banking District, joining Mr. E. J. Russell, of St. Louis, who is serving in a similar capacity for the St. Louis District. These regional committees together with the officers of the Council, who are acting in a like capacity for the Chicago and New York areas, now form the nucleus of a nation-wide regional origination which is being formed to keep the members of the Council and others interested in various localities of the country in closer contact with the work of the Council than has heretofore been possible.

(*Continued from page 744*)

In closing I wish to bespeak the full support of the construction industry and its allied business groups in furthering the work of the American Construction Council. In fact, everybody who pays rent or buys a home or building or other kind of construction, is affected by building conditions and should feel it necessary to support this movement. The idea back of this movement, dealing as it does with the economic problems of the construction industry in its largest sense and their relations to the permanent prosperity of the nation, is one of the biggest conceptions ever inaugurated in modern industry and should, with the safeguards that are provided for its impartial conduct, command the hearty support of forward looking business men.

I make it a rule never to write a grouchy letter—I telephone.

SEMI-ANNUAL STATEMENT BY AMERICAN CONSTRUCTION COUNCIL

The American Construction Council in its national survey of construction conditions just made reports healthy activity in the building industry generally. The volume of operations points toward as great a total for the present year as for 1925, although there has been a slight seasonal recession and the situation is somewhat spotted in various parts of the country. The amount of work scheduled and contemplated for winter operations is very favorable.

The character of operations is of a much more substantial type than that of the past few years, showing an increased demand for better built and properly financed buildings which the American Construction Council has been advocating so strenuously since the setting in of the building boom in 1922. This is by far the healthiest situation that has existed in the building industry for some years as there has been a very noticeable recession in new speculative building not backed up by adequate values, and a better class of business is coming upon the market.

The slowing down in housing construction further reflects a favorable trend, with an increasing demand for a higher class of apartments and hotels and of suburban homes, the need for which the Council emphasized during the peak period of indiscriminate house building the past few years.

Building operations in general show a larger percentage of structures for commercial and industrial purposes, public buildings and public utilities. There is a better supply of rentable space of good quality.

Material prices and labor are reported fairly well stabilized with no apparent indication of any radical change in the near future. Labor productivity is increasing.

Contracts for engineering construction show a very substantial increase over the first ten months of last year with equally favorable prospects as to proposed work.

Highway construction has been very active, the main obstacle being the lack of stable financing which would permit a continuous road building program in some states. Some of the trunk line railroads report the greatest capital expenitudes on construction for a number of years with a corresponding amount of projected work.

In general the reports favor the probability of well sustained business in all branches of the construction industry for some time to come. Some persons, however, urge caution along all lines of building operations except what is necessary for private use to meet the needs of industry in growing districts, feeling that this will help make for stability of values.

The great need continues for better conceived better financed and better built buildings, accompanied by intelligent city, town, and community planning not only as to building proper but also with regard to traffic conditions and health hazards. The public can now get, and should insist upon getting, full value for every dollar it puts into building. It should also insist upon getting similar values for the money it puts into highway construction, which means that it must demand not only better highways of first class construction but also stabilized highway building programs so as to permit economical construction.

ECONOMICS APPLIED TO THE CONSTRUCTION INDUSTRY

By G. Szmak, *Treasurer, American Institute of Quantity Surveyors.*

While it is true that there is nothing new under the sun, yet during the march of human generations everything is learned, forgotten and re-learned. It is the duty of everyone to investigate, teach and learn the things effecting human welfare in order that the man of today can live as complete a life as the man of yesterday or that of tomorrow, even though the ways and means may be different. All matter and principles forever remain the same. One of the most important conditions having effect upon human welfare is shelter against the elements. The work to provide this shelter is invested in what is probably the greatest single industry of men and women, known as the Construction Industry. This industry is composed of the Construction Designer, Surveyor and the Constructor and only when all three branches are intelligently utilized can the greatest efficiency, economy and durability result. The services and scope of those three absolutely essential branches of the Construction Industry are the subject in the continuation of this article, for the enlightment and guidance of the prospective investor, purchaser or owner of Construction Work.

Whenever we contemplate to erect a structure of any sort whether it is a large commercial building, a factory or a residence, if we act along the lines of proven efficiency the first thing we do is to secure the services of a competent Construction Designer, more generally known as the Architect. We have learned by example manifested through our own occupations that the man engaged in any particular calling is more fitted to be entrusted to do special work than if we were to do the work ourselves unaware of the principles of the work involved. The work of the Architect is to design artistically, economicallly and substantially, through a wise selection of materials and labor to be incorporated in his design, in such ratio as each characteristic may be required by the particular problem in hand. An Architect having fulfilled these requirements has done well his work. To expect him to do more would be to ask things beyond the scope of his profession; for instance, his work does not include the science of measuring and tabulating the quality and quantity of materials and labor required, nor the efficient practical erection of a structure which is within the province of the Construction Surveyor and Builder.

As we study the causes of high cost in materials and production we realize more and more that to erect the designed structure economically it is necessary to enlist the aid of and to know something of the science of Economics. "ECONOMICS IS THE SCIENCE OF CONSERVING THE ENERGY APPLIED TO TRANSFUSION, TRANSMUTATION AND TRANSPORTATION OF PHYSICAL AND SPIRITUAL MATTER."

The first essential principle of engineering is knowledge in the science of measuring and tabulating the intensity and resistance of energy included and the space occupied by physical and spiritual matter; in order to determine the exact extent it shall be necessary to apply or conserve energy in the process of transfusion, transmutation and transportation of the matter involved. The branch of engineering which deals with the intensity of energy—quality and space occupied—quantity of matter used in the erection of architectural and engineering structures is known as Construction Surveying—sometimes called Quantity Surveying among the profession and in some countries where it is practiced under such title. This branch of engineering is fast gaining in importance due to its high economic value in conserving energy—eliminating waste matter. "Construction Surveying is the science of measurement and tabulation applied to the physical members of a structure expressed in uniform units of measurement with an analysis and detailed accounting of its requisite *Quality* and *Quantity* of material and labor applications;" thereby eliminating waste matter in order to obtain the greatest economic result or value compatible with the desired Quality, Quantity and Price to be exchanged under the laws of Fair Competition. Persons engaged in the Construction Surveying profession are known as Construction and Building Surveyors and oftentimes as Quantity Surveyors, however, the former titles are more specific than the latter one and are therefore more generally recognized. The duties of the Construction Surveyor are well indicated by his title and the purpose of his profession is purely one of economics, i. e., the

elimination of waste matter in the process of constructing architectural and engineering structures. It is not within the scope of his profession to design or erect a structure, this work is handled more efficiently by the Architect and Constructor respectively. An experienced Surveyor can furnish information of great economic value to the Architect or his client in the efficient selection of materials and labor because he not only keeps posted on the relative cost of materials and labor but also has exact knowledge of what method in design of any given material will prove to be the most economical to construct deducted from his past experience and analysis of the amount of material and labor required for any particular of various designs. Such information can be had before the design or plans and specifications are even started, although, it is most often through neglect determined after even the construction work has been completed and it is already too late for changes. Construction Surveys can be used on Lump Sum, Cost Plus Percentage, Unit Price or any other form of contract. The survey will in any case perform its economic function. The cost of designing structures is usually from 3 to 10% of its physical value and the fee for the Construction Survey is about 25% of the cost of designing. The amount paid to the Surveyor is saved several times over by the survey through the elimniation of waste.

The Surveyor's fee may be paid by the owner, incorporated within the fees of the Architect or may be specified to be included within the contract of the successful Constructor. The Surveyor may be employed direct by the owner or his representative, the Architect or the Designer. The process of having a Construction or Quantity Survey prepared is simply to secure the services of a Surveyor upon the completion of the plans and specification prior to securing bids from the Constructors or Builders and when ready it is furnished to the bidders along with the plans and specification giving them an absolutely definite instrument of purchase; a complete plan with specific instructions and a survey expressing full intentions of purchase in structural dimensions, physical members in detail showing sizes, types, quality and quantity of materials and workmanship required to produce the desired structure. Construction, Building or Quantity Surveys are now available throughout the United States and also in a number of foreign countries.

The third essential service in the process of erecting a structure is pretty generally known, that of employing a Constructor or Builder; the right selection of which is not so easy as it might seem at first. The work of the Constructor is not to design or to survey a structure, but to construct accurately and substantially. Some of the qualifications that are helpful in making an efficient selection of a Constructor or Builder are as follows:

1. Agreeability to conduct his business under sound and open methods in dealing with his clientele.

2. Knowledge of his personal integrity or that of the organizations with which he is associated.

3. Reputation of competency to correctly execute physically the design of the Architect, i. e., his ability judged by past performance. These same recommendations are applicable also in the proper selection of the Construction Designer and the Construction Surveyor.

OUT OF THE MUD WITH LIME

There are more than two million miles of earth roads in the United States, according to the April, 1926, issue of American Highways, the official publication of the National Association of State Highway Officials. Although most of this mileage is unimproved, these roads feed the paved highways. But if it is impossible for a farmer to get his produce to a paved highway, that highway is of no value to him.

Two problems are involved in earth road construction and maintenance; one to prevent the road from becoming water-soaked and badly rutted—the other to restore it to good condition quickly and easily after a spell of wet weather. A practical and inexpensive solution to these problems has been found in lime treatment.

In 1924 the U. S. Bureau of Public Roads in conjunction with the State Highway departments of Iowa and South Dakota, and the National Lime Association cooperating with the University of Missouri, undertook investigations of the effect of lime in earth roads. The principle of liming heavy soils is not new, having been well established by generations of agricultural practice, but its application to earth road construction and maintenance was not developed until recently.

Tests were made in the field and in the laboratory over a period of two years, and the results are bringing the treatment to the attention of road builders because they indicate the solution of many of the problems which are encountered in sections where hard-surfaced roads can not be financed, or where maintenance must be made easier, quicker and more economical.

A highway system grows, developing from trails and earth roads, which are improved with various types of surface as circumstances warrant. There is a big difference between the cost of an earth road and the cost of a good gravel road, and frequently the gravel improvement is postponed because of its high cost, thus leaving the farmer with unimproved roads. An earth road treated with lime is much better than an untreated road, and will serve as an excellent foundation for gravel when increasing traffic makes that step necessary. In the meantime it is a good, serviceable road, and carries the traffic without excessive maintenance.

An earth road must be in reasonably good condition before it can be surfaced, and the lime can be added with a minimum of extra work while the road is being graded. In this way the cost of lime treatment is reduced to practically the cost of the lime alone. When treated with lime, the road will be found so satisfactory that additional expenditures for surfacing may be deferred. The lime-treated road will provide a suitable foundation for any further improvement that may be added at a later date.

Lime Prevents Rutting

When hydrated lime is mixed with the top layer of soil in the road, the soil loses its stickiness and does not cling to the wheels of vehicles. Because the wheels do not pick up the mud, the road remains smooth and excess water drains off before it has a chance to soak in. At the same time, the lime serves to stabilize the soil, so that wheels do not sink in when the road is wet. The road remains smooth and firm and is free from ruts during weather which would make an untreated road almost impassible.

The lime treatment produces a more porous, granular structure in the soil which permits more rapid movement and distribution of moisture, and prevents the surface from becoming soggy and unable to carry load. The soil structure is so open that the surface dries quickly and the treated road may be dragged many hours ahead of an untreated road.

Method of Treatment

The method employed will vary somewhat with the soil, the moisture conditions, and the tools available. If the soil is a heavy clay, the road should be dry when the work is started. It is best to plow the roadway to a depth of six inches, breaking about two inches at a time to avoid turning out large clods, using a brush plow, a rooter, or a sacrificer. Where a sacrificer on a light maintenance machine is used it has been found advantageous to move the loosened soil to one side with the blade after each trip. The loose soil is then broken up as fine as possible with a disc before the lime is spread.

Sacks of lime are distributed along the road and so spaced as to give the proper amount of lime per square yard. The lime is spread in a uniform layer and thoroughly disced into the loose soil. If the treatment is more than three inches

deep it will be necessary to turn over the loose soil with a plow during the discing in order to mix the lime and soil thoroughly to the full depth of the treatment.

Amount of Lime Required

The amount of lime required depends upon the type of soil. For instance, a heavy clay in Ohio reached its greatest stability with an addition of 2.8 per cent. of lime, while a clay from Central Missouri reached its maximum stability with 3.6 per cent. In pounds per square yard for a depth of six inches this is equivalent to 12.6 pounds and 16.2 pounds of lime per square yard, respectively. In estimating, the soil in place may be taken at 100 pounds of dry material per cubic foot.

TABLE I

Depth of Treatment	Pounds of Lime per Sq. Yd.			
	2.5%	3.0%	3.5%	4.0%
2″	3.75	4.50	5.25	6.00
3″	5.63	6.75	7.87	9.00
4″	7.50	9.00	10.50	12.00
5″	9.37	11.25	13.12	15.00
6″	11.25	13.50	15.75	18.00

TABLE II

Width of Road in Feet	Square Yards of Surface per Mile
12	7,040
14	8,213
16	9,387
18	10,560
20	11,733
24	14,080
30	17,600

Field practice indicates that less than 2.5 per cent. of lime is insufficient, while more than about 4 per cent. is unnecessary. With most of the troublesome clay soils an addition of 3.5 per cent. will be most effective, while for silty soils 2.75 per cent. will produce the desired results. For a six-inch treatment, this is equivalent to about 16 pounds of lime per square yard for clays, and 12.5 pounds per square yard for silt loams. There is no economy in treatments less than three inches in depth, and six inches has been found most satisfactory. Treatments of still greater depth are increasingly more effective, but require deep tillage machinery.

Lime Treatment is Durable

One of the sections of road treated with lime by the Engineering Experiment Station of the University of Missouri in 1924 was located in the Missouri River bottoms near Jefferson City. In the fall of 1925 this road was widened ten feet along one side and a heavy layer of the fresh black clay from the bank was spread over the treated section. About the time this was completed, and while the surface was still loose, the fall rains set in and the road became thoroughly saturated. Deep ruts resulted and the entire road was almost impassible until the summer of 1926. When the road finally began to dry, the only part which became smooth and firm was that part under which the lime treated soil lay.

An example of the other extreme of soil type is found in Mills County, Iowa. This type is technically known as Loess, a soil of low clay, but high silt content. A road in this county was treated in 1924 and has not had a rut in it since the treatment. In this soil 2.75 per cent. of lime was found sufficient to give good results. The treated road is holding up in perfect condition under traffic which averages more than 1,000 vehicles per day. The soil is firm and granular, and can be dragged from five to ten hours sooner than the untreated road.

T. E. Martin, County Engineer of Mills County, Iowa, who has had one of the experimental roads under close observation for over two years, states under date of September 18, 1926: "In regard to the experimental road east of Glenwood, will state that it is in fine condition although we have had a rainy Fall. This part of the road dries quick and does not rut deep, making the maintenance light."

Many Uses

In addition to its use in improving earth roads, lime can be used to stabilize the soil on roads which are to receive a thin layer of gravel or other wearing surface. Regardless of the type of surface which is to be put on the road, it is necessary to have the subgrade, or earth base, in such structural condition that the soil is stable. The stable subgrade will prevent many cracks and waves in the wearing surface.

In many localities the greatest expense in maintaining gravel roads comes through the sinking of the gravel into the plastic soil beneath and this loss requires resurfacing of the road at frequent intervals. When the road is treated with lime the structure of the soil is changed so as to increase its bearing power and keep it uniform under all weather conditions. The soil will no longer work up through the gravel and change the surface back to an earth road as may be the case when the lime treatment is not used.

The Highway Department of the University of Illinois has treated sections of black earth roads with lime before applying road oil, to stabilize the soil and at the same time prevent the formation of the troublesome emulsion which frequently forms beneath the oil mat.

For many years contractors have used hydrated lime to "dry up" mud holes around construction jobs. Where a soft spot develops, a few sacks of lime are spread, the trucks soon working it into the soil sufficiently to correct the trouble.

Farmers find lime treatment an ideal method for improving private lanes and for drying up barn lots and the earth floors in their stables. The lime corrects acidity, improves drainage, and makes a clean, firm, resilient floor, free from objectionable odors.

The rapid growth of commercial aviation has stimulated the construction of landing fields all over the country. Usually a considerable amount of grading must be done to level the field properly. This reduces the stickiness of the soil, preventing it from being picked up by the landing wheels and thrown into the propeller, thus reducing propeller breakage. As the surface of the field remains smooth, the sod will form normally as it is not torn up by the wheels. At the same time, the lime corrects acidity of the soil and encourages the growth of grass.

Major John Berry, Manager of the Cleveland Airport, writes under date of September 21, 1926: "I have delayed going on record as to the results obtained from this treatment because of the fact that I felt rather dubious about being able to speak as favorably as I should have liked to. However, I would now unequivocally state that the results obtained after nine days rain, are all that even your optimistic forecast predicted they would be."

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising or advertising from an emotional stand point.—Elbert Hubbard.

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE GROUND THAT ADVERTISING DOESN'T PAY!

"Camouflage" doesn't pay in advertising Don't call your cannon a bit of landscape Be honest and gain the confidence of the public.

"ANTI-HYDRO" Keeps this Huge Warehouse Dry

UNIT C, ARMY SUPPLY DEPOT, CHICAGO, ILL.
S. Scott Joy, *Architect.* E. W. Sproul Company, *Contractors.*

The concrete foundations of this enormous Army Supply Depot are waterproofed with "ANTI-HYDRO." The interior of the building is always dry.

"ANTI-HYDRO" was chosen for this job because "ANTI-HYDRO" results are known to be *permanent.* Twenty-two years of continuous use have proved that "ANTI-HYDRO" is the one dependable concrete hardener and waterproofer.

Being a liquid integral agent, "ANTI-HYDRO" mixes easily with the gauging water—any unskilled laborer can do it. It permeates the entire mass, producing uniformly hard and waterproof concrete *through and through*, instead of a thin surface coating.

Use "ANTI-HYDRO" on your next job and see how economically you can produce permanent concrete.

ARMSTRONG CORK HOUSES
AT DEVON, PA.

Six wonderful New England Colonial type houses, surrounded with old shade, and two minutes from Station.

Insulated throughout with Armstrong's Corkboard, 1½" thickness on all outside walls and 2" thickness on roof, effecting a fuel saving of at least 30% per heating season. All drafts are eliminated. A cork-lined house is many degrees cooler in summer. This is especially true of the upper floors.

Armstrong's Linoleum and Linotile floors installed.

Sample house is heated and open for inspection daily, 2 to 5 o'clock. Agent at Sample House.

As The Editor Sees It

THE FALLACY OF UNNECESSARY STRENGTH

Excessive and unnecessary strength in the use of mortar in the tremendous building program througout the country during the present year has cost the nation millions of dollars that might have been expended in new and needed structures, according to an extensive survey of the construction field by the National Lime Association (and discussed in detail) in a bulletin entitled "The Fallacy of Unnecessary Strength." This waste and extravagance is influencing the slackening of building operations; is retarding the building program and, in a broad sense, has its effect upon the general prosperity of the nation, it is asserted in the bulletin, which adds:

There is no place where the fallacy of unnecessary strength runs to more foolish extremes than in mortar. Certain materials have been promoted so vigorously on the score of their high strength, usually known by laboratory test only, that many builders have slipped into the mistaken idea that maximum strength is the only consideration. Field tests, or even laboratory tests of large specimens are usually lacking, and the lessons of generations of practical experience forgotten in the glamor of superlative strength claims. Also, the cost is usually in line with the claimed laboratory strengths.

During 1924 there were 7,844,363,000 bricks used in the United States. It is safe to assume that during 1926 there will be at least 8,500,000,000 used. In common bond these bricks require 4,725,000,000 cubic yards of mortar. A fair average price for the materials in a cubic ward of 1:3 mortar is $9.40 if Portland cement plus 10 per cent of lime is used, $7 with a 1:1:6 lime-cement mortar, $7.25 if bricklayers' cement is used, and only about $4.75 if lime is used. It costs as much to mix one kind of mortar as it does another, so that cost of materials makes a fair comparison. There are cases where the higher strength obtained by adding some Portland cement to lime mortar is necessary, but these cases would hardly total 25 per cent. If 75 per cent of these 8,500,000,000 bricks made this year are used for the general run of building, and are laid in lime mortar, the saving follows:

	1:1:6 Lime-Cement	Bricklayers' Cement	Cement plus 10% Lime
Cost of mortar for laying 75 per cent ...	$24,806,300	$25,692,200	$33,312,300
Cost of 75 per cent in lime	16,832,800	16,832,800	16,832,860
Saving if straight lime mortar is used	7,973,500	8,859,400	16,479,560

This saving alone would be enough to build from 1,600 to 3,300 homes costing $5,000 each year—and the country needs the additional homes far more than the wasted strength in other structures. In addition to the saving in cost of materials, there is a saving in time by the use of lime mortar, for the number of bricks a man can lay is governed on the job by the workability of the mortar. According to Dingman's "Estimating Building Costs" (1923), the average workman can lay 1,400 bricks per 8-hour day in a 12-inch wall (common bond) when he is using lime mortar, but only 1,200 when he uses a cement mortar. Using the same figures as before, the time required would be:

Cement mortars.....531,250 days
Lime Mortar .....455,360 days

BUILDING PERMITS

During October, 1926, permits were granted for the construction of 2,166 new buildings at a total estimated cost of $18,280,34, and for additions, alterations, or repairs to 1,534 buildings at a cost of $2,106,104, according to reports submitted to the Department of Labor and Industry from 42 cities and boroughs. The average individual building cost reported in October is 18 per cent. higher than the average individual building cost reported during any of the preceding 9 months. Since costs of building mate-

Brick, 3 stories, changing partitions, slate roof, hardwood floors, hot water heat, tile work. Plans completed. Owner ready for bids.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

WORLD FAMOUS STRUCTURES

TEMPLE OF KOM OMBOO, Egypt.

THE TEMPLE OF KOM OMBOO is one of the most remarkable of the many tombs to be found in the ancient city of Thebes, Egypt.

It is a double temple, constructed of stone, and contains a great doorway, a hall of columns and a double sanctuary, all of which are probably in perfect condition.

Built over 2000 years ago, it was dedicated to the Egyptian gods, Horns and Zebek. The Temple of Kom Omboo is now almost completely covered by the sands of the desert.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.—John D. Rockefeller.

(Continued from page 760)

rials and labor have not advanced correspondingly in recent months, it must be presumed that the October reports cover a larger number of commercial buildings and a higher type of residential buildings than average. The present tendency to build detached and semi-detached or duplex residences probably is accountable for the increased average cost.

Comparisons between years can be made only for 20 of the 42 municipalities. These show that construction operations amounting to 24,641,063 were reported in October, 1925, compared to $20,667,894 reported for October, 1926, a loss in 1926 of nearly $4,000,000, or 16 per cent. Five of the 20 cities report increased building

activity over October of last year. Those five cities and their per cent. of gain are Allentown, 223 per cent.; Harrisburg, 45 per cent.; Pittsburgh, 152 per cent.; Uniontown, 157 per cent.; and Williamsport, 18 per cent. These increases were sufficient to offset the losses in all other cities with the exception of Philadelphia. The volume of construction reported for Philadelphia during October, 1926, dropped more than $4,000,000 below the October, 1925, total. Other cities that show large declines under a year ago are Altoona, Bethlehem, Bradford, Easton, Erie, Lancaster, Reading, Scranton, Wilkes-Barre and York.

For the 10 months of this year the decrease in the value of permits granted in the 20 cities has been $53,267,000, or more than 21 per cent., lower than the first 10 months of 1925.

Saving if straight lime mortar is used..... 75,890 days

This saving would be equivalent to continuous employment for 316 men for twelve months, working twenty full days every month. If the bricklayers were paid at the rate of $1.50 per hour, their time would be worth $910,680. Also, for every hour of bricklayers' time which is saved there would be one hour of common labor time saved for the men who serve the bricklayers. Consequently, there is the additional saving of 75,890 days of common labor time, which at the rate of $.90 per hour would amount to $556,400. If lime mortar were used this saving would be:

Bricklayers' Time.....	$910,680
Common labor time....	556,400
Materials	16,479,500
Total.....	$17,946,580

This saving does not take into consideration additional cost of insurance, overhead, etc., important items to the builder.

Any building code will permit a loading of at least 90 pounds per square inch on brickwork laid in lime mortar. Most codes permit 100 pounds per square inch and some permit 125 pounds. The recent report of the Department of Commerce Building Code Commitee—"Minimum Requirements for Masonry Wall Construction"—states that when allowance is made for eccentricity and concentrated loading, bending, etc., a loading of 135 pounds per square inch is safe. Recent tests on ordinary good clay brick construction, made on sections of 8-inch walls laid up in lime mortar and broken at the Rock Island Arsenal, showed an average 28-day compressive strength of 695 pounds per square inch. Similar results were obtained on wall specimens tested at the Bureau of Standards.

The wall sections tested at the Rock Island Arsenal were checked to determine what loads had to be applied in order to produce a measurable settlement. The deformation found, even under heavy loading, was so small that it could not be determined on a building during construction, for a single grain of sand would be more than enough to compensate for the slight variation. If the lime-mortar wall one day old was 5 feet high, it would require the erection of 12 feet more of new wall the next day in order to produce a total settlement of 1-32-inch, or less than an ordinary grain of sand.

Lime mortar continually increases in strength, gradually changing into limestone surrounding the sand grains, making a binder which is frequently more permanent than the unit it holds in place. Also, lime mortar gives a perfect balance between compressive strength, tensile strength, and bond or resistance to shear. When used in the wall it gives uniform, even bearing and perfect bedding to every brick, making the most of every surface and binding the bricks together into a solid and uniform mass capable of resisting any forces which a wall must withstand. This uniform and even bedding is extremely important, for it utilizes the full area of the bricks to carry the load and avoid cracking. If high compressive strength alone was necessary, a strip of steel might well replace the mortar joint.

What is required of mortar is to bind masonry units together to make a wall that is strong enough to carry the load. Lime mortar is strong enough; it is plastic beyond any other mortar, and is without competition in price. A wall laid in good lime mortar is safe.

Men are walking by and around people that want to buy from them, and do not know it.

A LASTING TRIBUTE TO THE BUILDER'S JUDGMENT

Year after year a Masterbuilt concrete floor withstands the abuse of the hardest service—a lasting tribute to the builder who installed it.

Masterbuilt concrete floors for heavy industrial use are made Wearproof, Waterproof, and Dustproof by the use of Master Builders Metallic Concrete Hardener.

Sugar Cannot Harm These "ANTI-HYDRO" Protected Concrete Floors

The concrete floors in this building are subjected to a sugar condition which would ordinarily deteriorate them. To make the condition even worse, heavily laden sugar trucks are continually passing over these floors.

But "ANTI-HYDRO" has so thoroughly hardened the concrete that it is **absolutely impervious** to the action of the sugar, and withstands the trucking as well.

For 22 years "ANTI-HYDRO" has stood up under the most severe conditions. Use it on your next job for **permanent** results.

EFFECTIVE FACTORY HEATING

I. Selecting and Installing the Equipment

BY K. D. HAMILTON

Plant Engineer, George E. Keith Co., Brockton, Massachusetts

Reprinted by special permission from *Factory*, the Magazine of Management

How much to invest in a heating plant is somewhat a matter of location. Plants located in the northern part of the country, where the heating season extends seven to eight months, can well afford to install the most efficient equipment. The aim is reduced operating costs, both coal and labor, even at the expense of higher carrying-charges. Attention to labor-saving devices, to combustion studies, and to equipment which will produce steam at a low operating cost is well justified. However, factories which, because of the geographical location, do not require a large steam plant for heating, can afford perhaps a less efficient equipment, in view of the saving in investment.

One of the most widely used methods of heating in the northern portion of the United States is the direct steam system. This may be of the gravity, one-pipe, or two-pipe type, for the small plant; or the two-pipe vacuum system, for plants which are spread over several acres.

For a single building, of either the single-story or the multi-story type, the gravity system may be satisfactory, provided the mains are large enough to take care of both the steam supply and the return condensation.

Because of the more rapid circulation of the steam, even at lower temperature, the two-pipe gravity system operates much more efficiently, furnishes more rapid circulation, and can be operated at less expense. Modifications of this gravity system have been developed which employ the use of small ejectors and other specialties for removing the air from the system.

Use of the Two-Pipe Gravity System

These have a tendency to increase the circulation, in some cases even allowing the use of vapor and operation at pressures below atmosphere. I know of many large buildings in which a two-pipe gravity system with these additional features furnishes excellent results at minimum cost. These systems may be furnished with downfeeds, allowing the steam to be delivered first to the radiators on the top floor and then gradually working its way down through the building. Care should be taken, however, to provide sufficiently large steam mains and return lines.

The two-pipe vacuum system is most popular with the larger plants. It is very efficient because of the possibility of operating the return lines at below-atmosphere pressure. Steam is delivered to the various radiators and heating coils through the plant at pressures above atmosphere, the pressure depending upon the temperature required. It is possible to operate these systems on pressures as high as five or ten pounds, but very frequently extremely large plants can be efficiently heated on one or two pounds of pressure and five to six inches of vacuum. The advantages of the vacuum system are that for the same amount of steam and water handled, the pipes can be smaller than they can with the gravity system. The vacuum pump, located at the low spot in the system, is either motor-driven or steam-driven, depending upon operating conditions. It removes the condensate and air from the radiators, and it discharges the condensate to the hot wells or open feed-water heaters, to be used again in the boilers. However, vacuum traps must be provided on the ends of radiators and coils, to eliminate any possibility of the steam being carried over

into the vacuum lines. These traps increase the efficiency of the system, because, provided the traps are tight, there is no wastage of steam. The traps are of various designs. They may operate either mechanically or thermostatically. In the latter case they expand or contract, depending upon the temperature of the operating medium within the trap, allowing the water, but not the steam, to pass the valve.

Variations in levels between floors in different buildings often require the raising of the condensate to a higher level, in order to return it to the boiler. This is more likely to be the case in a large plant with scattered buildings, since it may not be possible to place the vacuum pump at the lowest point in the plant. When sufficient vacuum can be maintained on the system, water can be lifted several feet without reducing the efficiency of the equipment itself. I have known of cases where with heating returns five or six feet below the pump the water has been returned to the boilers satisfactorily.

The type of radiation used with steam systems will vary with the character of the building and the kind of operation carried on. Pipe coils are used primarily for factory work, since they can be placed under the windows at frequent intervals throughout the building and produce sufficient radiation. These coils are limited in length because of the expansion of long lengths of piping.

Cast-iron radiation is used in better class of buildings, primarily because of its appearance and because a larger amount of heating surface can be concentrated in a limited space. This is particularly needful in large buildings with extended glass areas, where considerable radiation must compensate for the heat losses through the glass.

Fittings should be provided at the discharge end of cast-iron radiators, to allow a rapid discharge of the water from the radiator to the trap, so that water will not collect and interfere with the flow of steam. Eccentric bushings are sometimes used at the trap connections to allow constant drainage of the radiator itself.

When steam coils are pitched to insure proper drainage, they can be trapped easily. A mud drum should always be furnished on the header at the end of the coil, to collect any sediment which might gather there. The trap which is connected to the mud drum will function to relieve any condensation which collects in the coil because there is no possibility of scale or dirt interfering with the moving parts inside the trap.

The rapidity of circulation will depend upon the temperature of the radiator. This in turn is influenced by the temperature, or pressure, of the steam on the inside. The higher the temperature in the radiator, the greater the velocity of the air passing over it and consequently the more rapidly the room will heat up.

The unit heater has seen rapid development in replacing cast-iron radiation and pipe coils as commonly used. A unit heater combines a heater section and a fan, making possible the erection of individual units in any portion of the shop. By recirculating the air, the building can be warmed at minimum cost in heating equipment. However, unless the air is thoroughly clean in the building, considerable dust will be moved from one portion of the structure to another. Unit heaters are admirably suited for isolated buildings, large open shops, and factory workrooms in general.

Unit heaters will furnish additional radiation in those portions of old factories which are hard to heat. Many factories can be kept warm except in extreme cold weather, when, to insure comfortable working conditions, it is necessary to force the boilers to the limit to drive the steam to the remote corners of the buildings. Small unit heaters solve this problem.

When steam is used in connection with ventilating systems, a large steam coil is located near the fan so that the fresh air can be forced through the coils and out into the building through a system of ducts. In such systems the steam pressure is usually automatically regulated by the temperature of the room.

Air washers and filters should be considered for use with an indirect heating system. Sectional filter cells can be erected in any number of units necessary to clean the air. Recently types have been devised which are admirably suited for installation in the suction line of a fan used for ventilation. Filters can also be used in connection with unit heaters.

Little do many managers realize the tremendous amount of heat which is removed from factory buildings by exhaust systems. After the dust has been removed from the air by some form of collector or separating system, this air can be recirculated through the factory, thus saving the heat. Before this air is discharged into the building again it should be cleaned by a filter.

Advance Construction News

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; LAST DAYS FOR FILING BIDS; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Hospital Building, Broad and Catherine streets, Philadelphia. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Howard Hospital, Strickland L. Kneaf, Chairman of Building Committee, on premises. Plans in progress.

College, Twentieth and Olney avenue, Philadelphia, $3,000,000. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, La Salle College, Brother Dorotheus, President, Broad and Stiles streets, Philadelphia. Stone. Sketches drawn.

Manufacturing Building (add.), Thirty-third and Reed streets, Philadelphia. Architect, Edwin A. Roth, Drexel Building, Philadelphia. Owners, Lipsky Brothers, on premises. Brick, stone, reinforced concrete slag construction, 4 stories, 90x110 feet, composition roof, cement floors, elevators, steam heat, electric light, rolled steel sash. Plans about completed. Architect will be ready for general bids in ten days.

Store Building, 626 Arch street, Philadelphia. Architect, Frank E. Hahn, Seventh and Chestnut streets, Philadelphia. Owners, Karr & Auerbach, 415 Market street, Philadelphia. New front, general alterations. Plans about completed. Ready for bids in a few days.

Residence (alts. to store and apartments), Nineteenth and Ontario streets, Philadelphia. Architect, Edwin A. Roth, Drexel Building, Philadelphia. Owner, Warren D. Meixner, 3100 North Twenty-second street, Philadelphia. Changing partitions, hot water heat, electric light, tile work, hardwood floors, painting and glazing, plumbing. Owner taking sub-bids.

Residences (16), Brill and Horrocks streets, Philadelphia. Architect, I. W. Levin, Elrae Building, Philadelphia. Owner, A. Rosen, 521 Porter street, Philadelphia. Brick, 2 stories, 16x48 feet, slag roof, hardwood floors, hot water heat, electric light, tile work, cement work, garage in basement. Owner taking sub-bids.

Church, Sixty-fifth and Lansdowne avenue, Philadelphia. Architects and engineers, William Steele & Son, 219 North Broad street, Philadelphia. Owners, St. Callistus' Roman Catholic Church, Rev. D. S. Coonahan, on premises. Stone, steam heat, electric light, slate roof. Architects and engineers ready for sub-bids in seven weeks. Plans in progress.

Laundry Building, Sixth street, North of Lehigh avenue, Philadelphia. Engineers, H. M. Wilson Co., People's Bank Building, Philadelphia. Owners, Tremont Laundry Co., 629 West York street, Philadelphia. Brick, mill construction, 1 story, 54x137 feet, trussed slag roof, wood and cement floors, plumbing, steam heat, electric light. Engineers will be ready for sub-bids in 10 days.

Parochial School, 623-25 Christian street, Philadelphia. Architects, Homan-Henon, Finance Building, Philadelphia. Owners, St. Mary's Magdalen Paizzi, Rt. Rev. Mgr. A. Garritano, 710 Montrose street, Philadelphia. Plans completed. Ready for bids in a few days.

Sub-Station, Broad and Mt. Vernon streets, Philadelphia. Owners, Department of City Transit, 1211 Chestnut street, Philadelphia. Plans about completed. Owners will be ready for bids in one week.

Sub-Stations No. 4 and No. 5, Louden and Carlisle streets, Philadelphia. Owners, Department of City Transit, 1211 Chestnut street, Philadelphia. Brick, steel, cut stone, granite, 1 story and basement, 89x73 feet, Cumberland and Park avenue, 85x65 feet, slag roof, cement floors, roof ventilators, dampproofing, architectural terra cotta, bond, marble work, rolled steel sash, bluestone, area gratings, steel partitions, limestone. Owners taking revised bids due December 14th at noon. Deposit, $50, refunded. Certified check, 5 per cent. of bid.

Apartment House, Wayne avenue, Chelten and School Lane, Philadelphia, $400,000. Owner, name withheld, care of E. A. Havens Co., Widener Building, Philadelphia. Size of lot, 120x160 feet. Announcement will be made in one month.

Sales and Service Station, Northwest Corner Fifty-fifth and Walnut streets, Philadelphia. Architect, D. Supowitz, 929 Chestnut street, Philadelphia. Owners, William Burstein & Bro., Sixty-first and Walnut streets, Philadelphia. Owners taking bids due December 10th.

Sales and Service Station, 5115 Frankford avenue, Philadelphia. Architect, Edward Schoeppe, 316 South Fifteenth street, Philadelphia. Owners, Roth Buick Co., on premises. Brick, 1 story, 76x64 feet, slag roof, cement floors, steam heat, oil burner, rolled steel sash, ornamental iron work. Architect taking bids due December 10th.

Stores (2), Apartments (6), Fifty-eighth and Springfield avenue, Philadelphia. Architect, Albert N. Dobbins, 1718 Cherry street, Philadelphia. Owners, J. N. McMichael Realty Co., on premises. General interior alterations, lowering floor, vapor heat, plumbing, carpentry and mill work. Architect taking revised bids due as soon as possible.

Alterations and Additions, 3731-35 Walnut street, Philadelphia. Architect, Lloyd Titus, Brighton Hotel, Atlantic City, N. J. Owners, Jerrihian Brothers, on premises. Stone, reinforced and structural steel, 3 stories and basement, 75x85 feet, steam heat, electric light, tile and marble work, rolled steel sash, skylights, kalamein and rolled steel doors, miscellaneous iron work, composition roof, cement and wood floors, cement work, elevator doors (Peele), plastering, mill work, painting and glazing, Indiana limestone, granite, ornamental terra cotta, waterproofing, ash hoists. Architect taking bids due December 13th.

Alterations to Cots and Girders in Loading Plant, 222 Lombard street, Philadelphia. Architect, Walter Smedley, Stephen Girard Building, Philadelphia. Owners, Abbott's Alderney Dairies, Thirty-first and Chestnut streets, Philadelphia. Architect taking bids due December 13th at noon.

Contract No. 130, electrical equipment in shop buildings and light in yard of Fern Rock Station, Broad Street Subway, Philadelphia. Owners, Department of City Transit, 1211 Chestnut street, Philadelphia. Deposit, $50, refunded. Certified check, 5 per cent. Owners taking bids due December 17th at noon.

Office, South side Lycoming avenue, West of G street, Philadelphia, $7,000. Architect, private plans. Owners, Philadelphia Electric Co., 1000 Chestnut street, Philadelphia. Brick, 1 story, 18 feet 4 inches x 84 feet 4 inches, slag roof, pine floors. Permit issued.

Residence and Store (add. and alts.), 4201 Mantua avenue, Philadelphia, $2,000. Architect, private plans. Owner, I. Kravitz, 3942 Brown street, Philadelphia. Brick, 2 stories add., 16x12 feet, general alterations. Permit issued.

Bridge, over Schuylkill River, Green Lane, Manayunk, Philadelphia. Owners, Commissioners of Montgomery County and Philadelphia County, W. C. Irvin and S. H. Noyes, City Hall, Philadelphia. Low bidders: Seeds & Derham, 6314 Wissahickon avenue, Philadelphia, $399,157; Whiting Turner, Baltimore, Md., $403,585.

Residence (alts.), 1511 North Nineteenth street, Philadelphia, $4,000. Architect, private plans. Owner, Samuel Gourley, 1938 West Erie avenue, Philadelphia. General alterations. Permit issued.

Shop, Northwest Corner Twenty-second and Washington avenue, Philadelphia, $3,000. Architect, private plans. Owners, Belmont Iron Works, on premises. Iron, 70x100 feet. Permit issued.

Residences (31), East side Devon street, North of Moreland street, $139,500. Architect, private plans. Owners, Jamison & Greider, 1524 Chestnut street, Philadelphia. Brick, 2 stories, slag roof, hardwood and pine floors,

Residences (17), East and West sides Morris Park Road, West of Sixty-sixth street, $122,000. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, McWilliams Meloney, City Line and Haverford avenue, Philadelphia. Brick, 2 stories, 18x33 feet, slag roof, hardwood and pine floors, hot water heat, electric light. Permit issued.

Residences (2), South side Fry street, West of Shalken street, $7,000. Architect, private plans. Owner, John B. Turrie, East Shawmont

Scope of Contract and Successful Bidders; "Inside" Information for the Material Man and Interior and Exterior Fitter.

Store (alts. to Bank), 6227 Lancaster avenue, Philadelphia Architect, Norman Hulme, 1524 Chestnut street, Philadelphia Owners, Susquehanna Title & Trust Co., 1611 Susquehanna avenue, Philadelphia. New limestone front, interior alterations, changing in heating and lighting, composition floors, bronze work, grills. Contract awarded C. S. A. Booth, 4355 Frankford avenue, Philadelphia, who is taking sub-bids.

Apartment and Stores, Seventh and Bainbridge streets, Philadelphia. Architect, Fred N. Greisler, 1035 Walnut street, Philadelphia. Owner, Mitchell Goldman, 1702 Walnut street, Philadelphia. Brick, steel, cement work, steam heat, electric light, metal lath, tile and marble work, slag roof, oak floors, ornamental iron work, demolition, painting and glazing, stone work. Contract awarde dB. Brnstein, Belfield and Wingohocking streets, Philadelphia.

Church, Northeast Corner Fifty-eighth and Springfield streets, Philadelphia. Architect, Horace W. Castor, Stephen Girard Building, Philadelphia. Owners, Berry Methodist Episcopal Church, R. McConnell, Sixty-first and Greenway, Philadelphia. Stone, cut stone, steel, limestone, 1½ stories, balcony and basement, hollow tile, steam heat, electric light, tile and terrazzo work, bond, ornamental iron work, iron stairs, demolition, architectural terra cotta, membrane waterproofing. Contract awarded H P. Schneider, 3713 Old York road, Philadelphia.

Residence, Henry road and Queen Lane, Philadelphia. Architect, John W. Keyes, 1520 Locust street, Philadelphia. Owner, T. Harry Keon, Manheim Apartments, Germantown, Philadelphia. Stone, 2½ stories and basement, 25x60 feet, wing 17x25 feet, shingle roof, oak and pine and linoleum floors, hot water heat, electric light, metal lath, rolled steel sash, ornamental iron work. Contract awarded Samuel Harting & Son, 20 East Johnson street, Philadelphia.

Garage and Apartment, 8005 Palmetto street, Fox Chase, Pa. Architects, Lippincott and Schaef, 11 South Sixteenth street, Philadelphia. Owner, William Amos, care of architects. Stone, brick, frame, 2½ stories and basement, 19x24 feet, shingle roof, cement and pine floors, hot water heat, electric light. Contract awarded George W. Botsford, 2401 North College avenue, Philadelphia.

Cottage C (alts), Fairthorn street, East of Ridge avenue, Philadelphia. Architects, Boyd, Abel & Gugert, Otis Building, Philadelphia. Owners, Fairmount Farms, on premises. Stone, electric light, carpentry and mill work, plastering, hardware, cement work. Contract awarded E. E. Hollenback, 1910 North Marshall street, Philadelphia.

Cafeteria (alts. and add.), Northwest Corner Eighth and Chestnut streets, Philadelphia. Architect, Fred N. Greisler, 1035 Walnut street, Philadelphia. Owner, C. M. Wessels, 917 Chestnut street, Philadelphia. Composition floors, carpentry and mill work, metal ceilings. Contract awarded Home Improvement Co., Inc., 226 South Fifteenth street, Philadelphia.

New Roof and Siding on Railroad Siding Connecting Two Buildings, Fifth and Glenwood avenue, Philadelphia. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, S. L. Allen & Co., on premises. Structural steel, 1 story, 190x20 feet, gypsum roof. Contract awarded P. Haibach Cont. Co., 1261 North Twenty-sixth street, Philadelphia.

Store Building (alts. and add.), Thirty-seventh and Walnut streets, Philadelphia. Architect, Max A. Bernhardt, 127 South Eighteenth street, Philadelphia. Owners, Sporkin & Fleisher, on premises. Contract awarded H. Alterman, 5949 Pine street, Philadelphia.

Service Station and Show Room, 4730-32-34 Baltimore avenue, Philadelphia, $110,000. Architect, I. W. Levin, 1011 Chestnut street, Philadelphia. Owner, A. Aiken, 145 Fairmount avenue, Philadelphia. Brick, 2 stories, 100x200 feet, slag roof, cement floors, electric work. Contract awarded to A. Brown, 145 Fairmount avenue, Philadelphia.

Store and Residence (add .and alts.), 747 North Twenty-fifth street, Philadelphia, $7,000. Architect, private plans. Owner, Peter McGee, 13 South Sixteenth street, Philadelphia. Brick, 2 stories, 18x15 feet 6 inches, general alterations. Contract awarded to Guerino-Marchini, 1344-46 Ellsworth street.

Storage Building (add.), 1104 Buttonwood street, Philadelphia, $5,000. Architect, private plans. Owner, L. Pizzoni, on premises. Brick, 2 stories add., 15x58 feet. Contract awarded to N. J. Brandolini, 1412 South Fifteenth street, Philadelphia.

Storage Building, 254 North Juniper street, Philadelphia, $3,500. Architect, private plans. Owners, J. H. McCullough & Sons, 257-59 North Broad street, Philadelphia. Brick, 2 stories, 18x100 feet. Contract awarded to W. N. Manuel, 5849 Ellsworth street, Philadelphia.

Residence (alts.), 6725 Ridge avenue, Philadelphia, $3,200. Architect, private plans. Owners, Fairmount Farms, on premises. General alterations. Contract awarded to D. H. Wetzel, 590 East Jamestown avenue, Philadelphia.

Store, 6437 Rising Sun avenue, Philadelphia, $3,000. Architect, private plans. Owner, Joseph Friedman, 4831 North Twelfth street, Philadelphia. Brick, 1 story, 25x60 feet, slag roof, pine floors, electric light. Contract

Store (alts.), 33 Broadway, Camden, N. J., $2,000. Owner, S. Jamieson, on premises. New store windows. Contract awarded to A. Kissler, 3231 Turner street, Philadelphia.

Residence, 3212 Rowe street, Camden, N. J., $3,700. Architect, private plans. Owner, Harry Crooks, 468 North Thirty-second street, Camden, N. J. Frame, 2 stories, 22x24 feet, slate surface roof, hot air heat, electric light, pine floors. Contract awarded to Edward Christopherson, 603 North Thirty-second street, Camden, N. J.

New Jersey State Highway Work. Ocean City-Somers Point road, Cape May County. Contract awarded to William Eisenberg, Camden, N. J., $62,820.29. Reconstruction of timber trestle bridge crossing Barnegat Bay between Island Heights and Seaside Heights, Ocean County. Contract awarded to Eastern Eng. Co., Atlantic City, N. J., $300,096.10.

Miscellaneous Construction News

Church, Richmond, Va. Assoc. Architects, Frank R. Watson, 1520 Locust St., Phila., and L. R. Hartsook, Richmond, Va. Owner, St. Stephen P. E. Church, Richmond, Va. Stone, slate roof. L. R. Hartsook, Richmond, Va., taking bids.

Church, Exmor, Va., $35,000. Architect, Albert N. Dobbins, 1718 Cherry street, Philadelphia. Owners, Broadwater Methodist Episcopal Church (South), R. E. Kellam, Exmor, Va. Brick, irregular in size, slate roof. Plans in progress.

Theatre, Stores and Offices, 161 Genesee avenue, Utica, N. Y. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, Stanley-Mark-Strand Corp., J. E. Mastbaum, 1916 Race street, Philadelphia. Seating capacity 4,000. Site will be cleared early in January, 1927. Work contemplated.

Residence (alts.), Oswegatchi, near New Haven, Conn. Architect, William F. B. Koelle, Otis Building, Philadelphia. Owner, Congressman Darrow, on premises. General alterations. Architect taking bids due as soon as possible.

Department Store, Akron, Ohio. Architects, Graham, Anderson, Probst & White, 120 Broadway, New York. Owners, M. O'Neill Co., Akron, Ohio. Brick, reinforced concrete, steel. Architects taking bids due December 20th.

Church, Aurora, N Y. Architects, Charles W. Bolton & Son, Schaff Building, Philadelphia. Owners, Baker Memorial Methodist Episcopal Church, East Aurora, N. Y. Stone, steam heat, electric light, slate roof, maple floors. Architects taking bids due December 13.

Plant (add.), Wilmington, Del., $38,650. Engineers, Kiebetz & Koenig, Baltimore, Md. Owners, Wiltex Co., 10 East Twenty-second street, Wilmington, Del. Brick, concrete, steel, 1 story and basement, 214 feet 4 inches x 86 feet, saw-tooth roof, concrete and wood floors, roof ventilators, heating extension, electric light, metal lath, steel sash and skylights, fire doors. Owners taking bids.

Building (add. and alts.) to 3 Apartments, 916 Jefferson street, Wilmington, Del., $5,000. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Del. Owner, John B. Dunbar, 507 Shipley street, Wilmington, Del. Brick, tin roof, pine floors, hot water heat, skylights, fire escape, interior alterations. Architect taking bids due as soon as possible.

Stores (add. and alts.), location withheld. Architect, John A. McKibbin, Industrial Trust Building, Wilmington. Owner, name withheld. Structural steel, plate glass, tile work, tile floors, metal lath. Plans in progress. Architect will take bids.

Building (alts. and add.), 1012 Washington street, Wilmington, Del. Architect, J. A. McKibbin, Industrial Trust Building, Wilmington, Del. Owner, Max Keil, 2103 Boulevard, Wilmington, Del. Brick, hot water heat, oak floors, alterations into three apartments, skylights, fire escapes. Architect taking bids due as soon as possible

Residences (4), West Ninth street, Wilmington, Del., $22,000. Architect, private plans. Owner, A. Fortunato, 1337 West Fourth street, Wilmington, Del. Brick, 2 stories, 20x31 feet, slag roof, pine floors, hot water heat, electric light. Permit issued.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Lowest bidders on work opened December 1st:

Contract 72A, Superstructure, Market Street Bridge over Christiana River, Wilmington, Del. Bethlehem Steel Co., Widener Building, $236,837.68.

Contract 74, Adamsville-Hickman, 2.82 miles. William Truitt, Lincoln City, Del. Stone: Metal, $67,009.62; non-metal, $66,126.64. Slag: Metal, $66,836.62; non-metal, $65,951.62.

Contract CS56, Greenwood-Adamsville, 4.28 miles. William W. Truitt, Lincoln City, Del. Stone: Metal, $94,947.65; non-metal, $93,817.65. Slag: Metal, $94,814.65; non-metal, $93,684.65.

(Continued from page 776)

Humidity is almost as important in heating as is heat itself. Most factories are uncomfortable when the steam-heating system is in use. It has been proved that factory buildings which are operated at a high temperature, but at a low humidity, do not feel as warm to the body as those which operate at a lower temperature and at a moderate humidity. An increase in humidity results in a saving of steam and creates more healthful conditions.

The hot-water system is very favorably considered by some engineers. It may be of the gravity or of the forced-feed type. Gravity systems are used primarily in plants with one building. The forced-feed system, however, makes it possible to heat scattered buildings with hot water. In the design of this system, great care must be used in proportioning the size of pipes, radiators, and other equipment. Because of the lower temperatures carried, the radiators will be slightly larger for this method of heating than for the steam system.

Care should be taken that equal pressure is exerted on all radiators, so that there will be no difference in the pressure drop in various portions of the system.

One advantage of the hot-water system is the accurate control by the engineer. Located in the boiler-room, he can either increase or decrease the temperature of the water leaving the boiler-room. With the steam plant, however, each radiator has an independent value and is under the control of the operating foreman.

Hot water furnishes a very even heat and is economical when small quantities of heat are required.

Hot-water systems can be so designed that exhaust steam or industrial process heat can be utilized as a pre-heating medium. Waste can be used.

With hot-water systems, reliable pumping equipment must be provided to insure constant circulation to all portions of the plant. It is advisable to install dual systems, to provide against a shut-down of one unit.

Hot-air heaters of extremely large size have been developed for use in erecting shops, foundries, machine-shops, paper mills, and other buildings of large size and height. These heaters consist of a large bank of steam coils, which is enclosed in a housing, and through which air is circulated by a fan. The air is discharged into the room. The principle is the same as that of a unit heater. They eliminate the expensive heating system of pipe coils or radiators, and where unusually large volumes of air must be handled they are very efficient. They have the advantage of taking up a small amount of floor space, being able to heat an exceptionally large room at minimum cost.

The fans on these heaters can be either motor-driven or engine-driven. Exhaust from the engine can be turned directly into the heater. A connection with the outside provides the needed fresh air. The fan does not handle the heated air.

Often coal-fired, hot-air heaters can be substituted where it is impractical to furnish heat by steam coils.

However, many hot-air systems are being replaced by the centralized heating plant with heat distribution by steam or hot water.

Electric heat is being used for heating isolated portions which cannot be connected with the main systems. Individual heating units have been perfected for watchmen's houses, gate houses, elevator houses, and other remote portions of the

GENERAL INSURANCE | SMITH-AUSTERMUHL CO. 5th and Market Streets, Camden, N. J. BELL PHONE, CAMDEN 3210 KEYSTONE, CAMDEN 3147 | SURETY BONDS

plant. A small electric-heating unit, attached to the lighting system or the power circuit, will overcome many difficulties which plant men experience through the freezing up of sprinkler pipes or the water system.

There has been considerable discussion as to the relative efficiency of transmission of heat through a steam coil or through a cast-iron radiator. Which is the best method depends upon the size of the pipe coils or radiators, the velocity of air passing over the radiators, and the temperature difference between the steam or water inside the radiators and the room. It has been found, however, that the heat given off by various types of radiation will vary from 1.5 B.t.u. to 2.5 B.t.u. transmitted per hour per degree difference in temperatue, per square foot of surface. For hot water 1.5 B.t.u. is used.

A rough estimate of the amount of steam condensed in a radiator can be obtained by assuming that .3 of a pound of steam will be condensed per square foot of heating surface per hour, when operating at about 3 pounds gage pressure.

The Importance of Adequate Ventilation

The ventilation problem in connection with heating buildings is just as important as that of supplying the heat itself. Most large office buildings, especially those where many people congregate, have a dual system of heating and ventilating. The cast-iron type of the wall type of radiation supplies the heat and a secondary system of ventilation furnishes warm air in winter and cool air in summer. These ventilating systems are designed to provide an air change at least once or twice an hour, depending upon the conditions. Air changes as high as once in five or ten minutes are sometimes advisable in rooms where many people congregate. Employees will work much better when housed in buildings where an adequate supply of fresh air can be maintained.

State ordinances generally definitely define the number of cubic feet of fresh air per person which must be pumped into buildings, the temperature which must be maintained, and various other working conditions applying to female employees. In some instances state ordinances specify humidity conditions.

The steam portion of the ventilating system is usually independent of the heating system, operating entirely automatically from thermostats placed in the various ducts or rooms about the plant. The air for office buildings, theaters, and hospitals is generally taken from the outside, passed through a system of filters and then through a bank of steam coils, where it can be distributed through a series of ducts to the entire building, at velocities which will create the required air change.

In addition to this system of heated air supply, there is usually a companion system of ducts, with a fan on the roof to remove the contaminated air. Sometimes these systems are combined by means of an air washer or filter, whereby the heated air removed from the building by the exhaust fan can be recirculated through the heating duct. The maintenance expense is rather small because the equipment is compact. The fan and driving mechanism constitute the only moving parts. A building can be warmed in a very few minutes in the early hours of the winter mornings by providing an adequate number of steam coils, through which steam is supplied at various pressures.

This results in a saving in coal, since it is unnecessary to keep the steam on all night in the wall-type radiation.

Automatic controls for humidity systems have been perfected to such an extent that they prove very accurate for practical operations in connection with heating systems. This is particularly true in those plants in which, because of the process work, it is necessary to keep the humidity constant.

The design of a factory building has much influence on not only the first cost of the heating system, but also on its operating cost. Engineers and owners should work together in this matter.

Such items as the glass area, the size of the roof, the material with which the building is to be built, the height of the ceiling, the width of the building, the manufacturing processes themselves—all affect the location, size, and method of operation of the heating system.

Whether the building is of the single-story or the multi-story type is important in deciding on the type of heating system. A single-story building spread over a large area presents extreme radiation losses through a large exposed roof. A multi-story building can be heated by less radiation per cubic foot than can a single-story building of the same volume.

Skylights Increase Heat Losses

Roofs frequently have massive skylights, with ventilators attached. Thus we have large areas of good heat conductors, increasing the heat loss. Insulation of roofs not only saves in the coal bill, but it eliminates the condensation liable to collect on the roof where steam is used in process work.

Exposed factory buildings will require more steam and will have a greater area of radiation than those which are surrounded by buildings of equal height. Buildings which are located on a water front, exposed to the full sweep of the wind, find heating extremely expensive.

The modern type of concrete buildings, with extremely large window area, requires more radiation per cubic foot of volume than any other type of structure. This factor has brought into use cast-iron wall radiation, because large areas of radiation can be concentrated in a small space and can be placed under the window between the sill and the floor.

Wind velocities and wind directions must be considered in obtaining a uniform distribution of heat.

The conditions of the windows and other exposed fixtures can affect the coal bill greatly. Reduction of air infiltration is important not only in reducing the expense of heating but in maintaining the health of employees. Wooden sashes which are so loose as to rattle in their frames should receive the constant attention of the maintenance department. Air changes of three or four times an hour are possible where the windows are not tight. Metal weather-strips are used to advantage on wooden sash. This applies also to steel sashes which are poorly erected. Some of the steel members can become bent in construction, the ventilators do not fit, and the frames are not set properly in the concrete pilasters. In brick buildings, it is possible to calk the joint sides between the brickwork and the wooden sash with a plastic cement.

The amount of air which leaks through a building depends primarily on the difference in temperature between the inside and outside of the building, as well as on the velocity of the outside air.

Factors Affecting Cost of Heating

The height of ceilings has a material effect on the cost of heating. The larger the cubical contents, the greater amount of air which must be heated, the greater the air losses, and, consequently, the larger is the heating system required.

The effect of the sun's rays on large exposed areas of glass will materially assist in heating buildings. It has been my experience in heating large reinforced-concrete factories that when the sun is shining it is possible to shut the steam off much earlier than on a cloudy day.

The type of work carried on affects the heating. Rooms in which table work and light manufacturing is performed require a higher ratio of radiation per cubic foot of volume than those rooms where the work requires considerable exertion, as for instance in woodworking shops, machine-shops, and foundries.

Then again we must consider the heat given off by forges, electric heating apparatus, gas ranges, and even the heat of friction of such apparatus as motors, generators, transformers, and line shafting.

The heat given off by employees is an important factor. Whereas an ordinary gas flame will give off between 3,000 and 4,000 B.t.u. per hour, an operator at work will furnish between 400 and 500 B.t.u. per hour. It is also interesting to note that one B.t.u. results from every 778 foot-pounds of work expended.

Then we have the effect of heat given off through radiation of steam pipes, hot-water lines, return lines, process-steam equipment, cooking kettles, and steam engines.

Although experience determines the location of the radiation about the room, there are certain basic principles which must always be employed. Where practical, radiation should be placed under the windows, so that the heated air can pass by the window, warming the air which filters through the cracks and crevices before it has a chance to settle to the floor and to chill emloyees in the immediate vicinity. It is good practice to place wall radiation at least three or four inches from the wall, thus allowing all portions of the heating sytem to give off heat to the circulating air.

All building materials and equipment shown at the 1927 annual New York and Chicago "Own Your Home Expositions" must submit to a severe test before they are accepted by the management under a new policy laid down in each city.

The organization of these annual Expositions is becoming more rigid each year, and certain manufacturers who are entirely reputable will not measure up to the high standards now required by the Expositions. At the New York Ninth Annual Exposition to be held in Madison Square Garden, February 19th to 26th, 1927, and the Seventh Annual Exposition to be held in Chicago at the Coliseum,, April 2nd to 9th, this plan will be known as an "Inspection Before Acceptance For Exhibition."

Commenting on this action, Robert H. Sexton, Managing Director, who inaugurated these comprehensive shows nine years ago, says:

"The Exposition management believes that it should not assume a competency it does not have in judging material values. As a result of this decision there will be accepted for exhibit only building materials that are included in the official classification covering the character of building materials eligible for exhibit, and then only after each individual concern has been approved and recommended by the exhibit committee under whose classification it belongs. Following this we now require a test of material quality by the Architectural Committee on Management, whose final approval is necessary before the product is accepted for exhibit.

"While this precautionary condition has been adopted to even more completely protect the interests of those for whom 'Own Your Home' Expositions primarily are conducted, as well as for the protection of legitimate manufacturers and dealers in building materials and equipment, every encouragement is given through the Exposition for the production and use and exhibit of other suitable materials, when such materials, through tests under proper engineering supervision, have proven of substantial value."

"A Court of Homes," featuring an artistic grouping of a number of full sized homes built in the various accepted and proper materials, will be a feature of both Expositions. "The Court of Homes" is being planned in a way that will interest architects and builders, as well as prospective home owners. The houses will be of concrete, masonry, brick, frame, stone and other materials that have demonstrated their worth, permanency and economy. The selection of the architectural designs and the actual construction will be supervised by Architectural Committees, composed of eminent architects.

New Exhibit Committees are being appointed to supervise the various divisions in the Exposition that include home financing, planning, building, equipping, furnishing and landscaping. These exhibits are being assembled under the Exposition "Code of Ethics" which bars all irrelevant displays, stunts and circus features, and which provides for all of the methods, materials, products and equipment that enter into the modern home. This "Code of Ethics" was drawn two years ago by the Expositions, and some forty national trade organizations and associations, and it has been altered this last Summer to bring it up to date with recent advances made in the home building field. This document is the Constitution of the Expositions and works for the protection of the thousands of prospective home owners who attend the Expositions and the twenty-five or thirty trades represented by the Exhibitors.

Sale of exhibit space in both cities is far in excess of the amount sold at this time last year, according to reports made at recent meetings of the Committees of Administration. The Expositions are held under the auspices of the local real estate boards in each city.

THIS IS THE AGE OF RIVETED STEEL

Address Delivered by A. F. JENSEN, *President, Hanna Enginnering Works. Before Members Attending the Annual Convention of American Institute of Steel Construction, Incorporated, Held in White Sulphur Springs, West Virginia on October 27th*, 1926.

The comparison of welding with riveting is the natural result of the development of a new manufacturing or construction process to meet the competition of existing methods. Let us divide this comparison under the headings of *Cost, Dependability: Introducing a Method to the Industry; Effect of Both Methods on the Worker and the Public;* so well as *The Future Development of Both Arts.*

Riveting is one of the oldest arts and there are no intangibles when considering its application. Accurate data is available regarding every phase and type of riveting; inaccurate assumptions on the riveting side of the comparison are inexcusable. Welding, however, has not progressed to a point where authentic data is available, leaving this side of the comparison to be based upon assumptions only.

It is evident the manufacturers of welding equipment have determined the labor cost of making a seam of given length and kind, which cost is merely one factor of the final cost. The determination of this final cost should naturally rest with the structural steel industry. The present activity of the American Bridge Company in fabricating and erecting a five story steel building for the Westinghouse Company will provide some cost data, but must not be construed as an acceptance by them of the process.

Claims of lower cost and superiority of product must be demonstrated by actual performance of plant and equipment wherein welding is used for joining plates, shapes, bars, etc., of the type constituting the nation's tonnage. Whether the welding of structural steel members holds advantages over the rivited structure can only be determined by undertaking its fabrication on an every day commercial basis.

In seeking information on the dependability of welding one naturally turns to the industry with experience in that process. Extensive data on both riveting and welding has been accumulated by the Bureau of Locomotive Inspection of the Interstate Commerce Commission and we quote the following from an informal talk by A. G. Pack, which appeared in the April 26, 1926, issue of *The Daily Metal Trade* reporting the annual meeting of the American Welding Society:

> "Another expression on the inadequacy of the present information on welding was voiced by A. G. Pack, chief inspector of locomotives, Interstate Commerce Commission. He said flatly that the use of welding has not had uniform results on the railroads of the country. * * * Mr. Pack thought that until he could feel sure that welding is safe, and that the safety of the weld is something that does not depend entirely on the training and skill of each individual welder, he could not conscientiously encourage welding in connection with locomotive repairs."

Again we quote Mr. Pack, this time from his recent address before the Traveling Engineers' Association in Chicago, in which the following analyses of failures are quoted:

> *"Boiler barrel:* Circumferential cracks developed in the solid plate at the edge of welding which had been applied to seal the caulking edge of circumferential seams. Of five similar boilers treated in this manner three

failed to such an extent that they could no longer be used, the remaining two were then retired from service in order to prevent the possibility of further trouble."

"Boiler back head: Fusion welded crack in back head failed. Failure occurred while the locomotive was hauling a passenger train at an estimated speed of 35 miles per hour. The escaping steam and water seriously scalded the engineer and compelled him to leave the cab without being able to close the throttle or apply the brakes. The engineer, mortally injured, climbed out over the running board and stopped the train by opening the angle cock on the front end of the locomotive."

He concludes his address with—

"I do not desire to be understood as opposing fusion welding when properly and discretly used, and believe that it has a very wide and useful field. If we are to profit by the experiences of others, we must give careful consideration to the result of all practices and methods. The extreme to which fusion welding has been carried is what I have taken exception to. It is not a cure-all, nor can it be used indiscriminately with safety, nor even economy."

The Locomotive, house organ of The Hartford Boiler Inspection and Insurance Company, has from time to time presented data on disastrous explosions attributable to welding. We quote from a recent issue:

"This accident again emphasizes the unreliability of autogenously welded joints for pressure vessels; and it also shows the inavisability of testing new vessels by air pressure, even at as low a pressure as 15 pounds. A riveted joint may be inspected and reasonable assurance of its soundness thereby obtained. Not so, however, with a welded joint, as the external appearance does not give a true indication of its soundness."

Again we quote from *The Locomotive,* this time its article, "Some After effects of Welding on Boilers" (July, 1925, issue):

"Eight years ago a battery of five boilers, all of which were made by a prominent and reliable manufacturer, located in the power plant of a factory developed chronic leaks along the girth seams. It was thought that sealing by welding would most readily solve the problem and so an acetylene welder was called in. This did not remedy the trouble permanently, however, and shortly after more welding was done, this time by electric arc method. All five boilers were effectually sealed by more or less of this treatment and gave practically eight years of service without any serious interruptions.

Recently the night watchman of the plant reported having heard a distinct report in the boiler room between 3 and 4 o'clock in the morning but was unable to locate anything wrong. The next day, one of the firemen reported having heard a similar noise between 11.00 A. M. and 12.00 M. Later on the same day upon getting up a few pounds presure in a boiler that had lain cold the cause of the mysterious noise was revealed. A circumferential crack was discovered in the solid plate right at the edges of the added metal on the first girth seam. At first it was believed to be a short crack about 12 inches long and subject to patching, but it was found upon investigation to extend so far around that the boiler was immediately condemned.

Realizing that the other four boilers had been treated in a like manner at the same time, some concern was felt for their safety. Internal stresses such as had ruptured the first boiler might also be present in the others, yet there was no ready way of determining this. While the question was still being debated, it was suddenly settled in a decisive manner. Within a month, two of the other boilers suffered a like failure, and under almost exactly the same conditions. Eight years of service had not removed the strains of localized heating and cooling."

A very interesting article, "Are Welded Pressure Tanks Safe?" by Mr. John S. Spicer, chief of the accident investigation section, Bureau of Inspection, Pennsylvania Department of Labor and Industry, has appeared in the November, 1925, issue of the *The Boiler Maker.* Several failures of welded air receivers are described and he concluded with "Within recent years the Department of Labor and Industry has not heard of the failure of a riveted tank when used for similar purposes under similar conditions."

Mr. A. J. Lamie, in an article, "Are Welded Pressure Vessels Safe?" in the August 31, 1926, issue of *Power* says:

"I have seen dozens of welded air tanks that exploded under normal working pressure from 200 down to 40 lbs. per square inch. In every case the initial rupture was traced to a weakness produced by the act of welding, usually embrittlement, sometimes insufficient fusing. Of the several riveted air tanks I have seen after explosion at normal working pressure, none failed in the seam. The usual cause has been internal corrosion."

Under the heading of "Impracticability of Welded Joints in Unstayed Portions of Pressure Vessels" in the May, 1926, issue of *The Boiler Maker,* Mr. R. L. Hamilton had this to say:

"Personally, I have never seen recorded a failure of a perfected riveted lap or butt joint, unless the allowable pressure of the particular vessel was greatly exceeded. But I have seen and officially known instances of failures in welded joints before half the allowable pressure had been reached and the serious objection regarding the nature of the failure is the fact that when a failure develops it generally goes the limit of the weld, completely tearing away the whole portion. Whereas, in a well riveted joint, even when the rivet shears or a portion of the plate tears between rivets, no serious results develop."

The first element to be considered in steel where fatigue resistance is a factor is ductility. Metallurgists have plotted curves which show the length of life decreases as brittleness increases. Recent fatigue tests indicate that a corroded or oxidized surface contributes to the development of fractures. Many of the defects which frequently appear in the cast metal in a weld, such as gas pockets, slag and oxide inclusions, lack of fusion, stratification or layers, seams and cracks, are such as will hasten fatigue failure. The normalized steel of a rivet is far superior to the metal in a weld cross section in respect to fatigue.

Structural engineers will welcome the results of fatigue tests upon representative welded joints where the intensity and number of load applications are given.

The rivet is the most reliable and dependable element of the engineering field and I might add the most inconspicuous. Riveted structures which have been in service for years give mute testimony to this fact and any reference to the few instances where rivets have become loose is not a constructive analysis.

Many riveted joints are made where conformance in design with good theory is impossible and the rivet is, therefore, liable to work loose. A properly designed riveted joint will not move unless the stress far exceeds that for which it was designed.

(To be Continued.)

The Annual Meeting of the Philadelphia Builders Exchange and Employers Association will be held

Tuesday, December 14th, 12.30 P. M.

at the Bellevue-Stratford Hotel, when the result of the election of Officers and Directors for the ensuing year will be announced, and when such other business will be transacted as may properly come before the organization at that time.

The speaker for the meeting will be Christian G. Norman, Chairman of the Board of Governors of the Building Trades Employers Association of the City of New York. Mr. Norman will give the inside workings among the Building Trades of New York City.

Sugar Cannot Harm These "ANTI-HYDRO" Protected Concrete Floors

The concrete floors in this building are subjected to a sugar condition which would ordinarily deteriorate them. To make the condition even worse, heavily laden sugar trucks are continually passing over these floors.

But "ANTI-HYDRO" has so thoroughly hardened the concrete that it is **absolutely impervious** to the action of the sugar, and withstands the trucking as well.

For 22 years "ANTI-HYDRO" has stood up under the most severe conditions. Use it on your next job for **permanent** results.

As The Editor Sees It

THIS IS THE AGE OF RIVETED STEEL

Address Delivered by A. F. JENSEN, *President, Hanna Enginnering Works, Before Members Attending the Annual Convention of American Institute of Steel Construction, Incorporated, Held in White Sulphur Springs, West Virginia on October 27th,* 1926.

(Continued from Last Week)

Testing by tapping discloses a rivet which does not grip the plates even though the rivet fills the hole. Rivets which will not pass the tapping test may be tightened by striking them again with the riveter, even though the rivets be cold. Such rivets are usually stitching rivets through heavy grips, all of which proves that the frictional value of plate upon plate is a real, definite, tangible, factor. Welding seems to offer no way of obtaining this frictional value. Any attempt to analyze the action of a riveted joint by the observance of a joint made of rubber is misleading. To attack the dependability of a riveted joint is to question the intelligence and the experience of the steel construction industry. The gradual deterioration (and it is decidedly gradual) of a riveted joint will give forewarning of its deterioration long before actual failure, whereas a weld will give no warning whatsoever, nor is its failure gradual.

There is not an important bridge in service today which was built thirty or more years ago that is not carrying loads far in excess of those originally contemplated and the same may be said of steel buildings. Is there a better monument to the dependability of the riveted joint?

Approximately 150 rivets are required per ton of structural steel. Machine driven rivets predominate. Each and every stroke of the compression yoke riveter sets the rivet with a predetermined tonnage produced irrespective of the judgment and skill of the operator and with the certainty that sufficient pressure has been exerted on each rivet.

A machine driven rivet always fills the hole. The upsetting or forming of the head requires such intense pressure per square inch of head cross section that the hole must be completely filled before the rivet metal therein can resist this head forming pressure. A filled hole is only one of the essentials of a properly driven rivet as a rivet which fills the hole but which does not grip the plate will be rejected. Compression rivet operators drive rivets which grip the plates firmly because a simple inspection will surely disclose rivets which are otherwise.

There is nothing a riveter operator can do or cannot do to appreciably reduce the value of a rivet without evidence that can be quickly detected by inspection; a burned rivet can be identified by appearance and a loose rivet by tapping. The operator of a riveter need only practice care that the rivet temperature is within a range of 500 degrees F. and the machine will take care of the rest. Prevention against burned rivets is more a matter of provision of proper heating devices than care upon the part of the rivet heater. Because of the human factor in welding, no weld is better than the welder.

In all data on structural welding which I have read it is obvious that the welder knew the weld was for test purposes. The most skilled and conscientious welders have been employed; supervision has been close and comprehensive and the conditions have been test conditions, all of which will not prevail on mass production.

Methods and machinery used in riveting have practically eliminated the necessity for skilled workmen. Industry's greatest problem today is that of manpower and it is, therefore, but a logical

conclusion that those qualified by experience in the problem of the fabricating shop should consider the importance of the human element in welding as paramount.

The supply of riveter operators is only limited by the supply of unskilled labor. Structural shop unit costs have been reduced with the development of spacing tables, gang punches, etc., and fabricating profits are largely influenced by assembly costs. Every experienced fabricator and manufacturer realizes the importance of having units come to the assembly stage so that the possibility of error and the necessity for skilled labor are reduced to the minimum. Riveting accomplishes precisely that.

One of the great advantages of riveting is in the aligning and locating value of the matched rivet holes. They predetermine the squareness of the structure irrespective of the erectors. Rivet holes are located in the shop where their accuracy may be established with certainty and economy and with the assurance that the discriminating plans of the designing engineer are conformed to in the field. They establish location, level and squareness surely and quickly.

Proponents of welding say, "It is more important in a welded structure that plates be kept free from kinks and buckles than in riveted work, where a number of bolts may be used through rivet holes in bolting up." It is probable that in plate structure a number of holes will nearly always have to be provided for assembling. By judicious thought, and the passing of the plates through straightening rolls before assembly, the number of holes may be reduced to a minimum. These factors must not be lost sight of in computing costs. A considerable item of cost not incurred in riveting but necessary when welding is that beams must be machined to exact length and ends squared. Then too, considerable additional drawing expense will be incurred by erection drawings essential when welding.

A large amount of space in technical and semi-technical publications has been devoted to forecasts of the possible achievements by the adoption of welding. To compare this possible future development of welding with riveting practice as it now exists is to assume that the riveting art is at a standstill, an assumption not justified. In the riveting art we may look forward to the introduction of portable yoke riveters, much lighter than machines now in use, alloy steel rivets, the acceptance of cold riveting, power actuated mechanical devices for the manipulation of riveters on straight run work whereby the bucker-up is eliminated and the operator controls two or more riveters merely by the manipulation of valves making it possible for a crew of four men to drive at least fifty rivets per minute and the introduction of multiple riveting machines which will drive at least a dozen rivets for each operation cycle. A combination of cold riveting and multiple riveters constitutes the most promising possibility for the reduction of structural steel fabricating costs.

The broad publicity which has been given to welding of steel buildings when so little progress has been made to prove that buildings may be erected without the use of the pneumatic riveter has created a clamor for the elimination of the noise prior to the development of sufficient evidence that it can be done. In the meantime the structural steel industry is likely to confront unreasonable and unjustifiable demands for the elimination of the much discussed din of the riveting hammer—without thought or consideration of the possible loss of human life and property damage by the substitution of an untried process. Will the benefactors who make the unreasonable and unjustifiable demands to relieve the dear public from the nerve-wrecking riveting hammer agree to protect the same dear public from the harmful and disconcerting effect of the blinding ultra-violet rays of the arc?

Down through the centuries, man has been experimenting with minerals, striving to develop steels that could be relied upon to possess the greatest strength. Wherever steel plates and shapes are joined, riveting has proven the most dependable method of bringing their seams together. This strength can be mathematically predetermined.

Our nation's greatest battleships are marvelous demonstrations of the dependability of riveted steel.

The world's finest railroad equipment, the development of centuries of applied engineering, is built of riveted steel and carries to destination with dazzling speed in safety its cargoes of humanity and merchandise.

Bridges flung across broad rivers support their burden of thousands speeding back and forth through heat and cold, rain and snow, unconscious of the span they cross, making cities larger, homes nearer, waterways passable all because engineers

Proposal

ADVERTISEMENT FOR THE CONSTRUCTION OF A HIGH SCHOOL BUILDING AND ALTERATIONS TO THE PRESENT SCHOOL BUILDING FOR THE BOARD OF EDUCATION, MERCHANTVILLE, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip, ready for furniture, a High School building; adjacent to and connected with the present Public School Building, and to make alterations in present building, will be received by the Chairman of the Building Committee of the Board of Education of the Borough of Merchantville at the School Building on Tuesday, December 28th, 1926, at 8 o'clock P. M., at which time all proposals submitted will be publicly opened and read.

The High School Building, includes the School, and Auditorium building. It is to be constructed with concrete and brick walls with concrete floors supported on a structural steel frame with fireproof construction. The building contains approximately 520,000 cubic feet. The alterations to the present building consist of changes in basement and first floor, as shown on plans and as specified.

Said proposals must be on blank forms provided by the Architect for that purpose and must be enclosed in sealed envelopes endorsed "Proposals for Merchantville High School' and must state the branch of work for which the proposal is submitted.

No bid will be considered unless accompanied by a certified check to the amount of five (5%) percent of the bid, binding the bidder to execute a contract if awarded to him, and also a statement from a surety company that it will furnish the contractor with a bond for the full amount of his contract, binding the bidder to execute a contract if awarded to him.

The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is reserved to accept any or all bids submitted, also to waive any informality in the same.

Copies of the drawings and specifications will be on file at the office of the Architect, Mr. Arnold H. Moses, Temple Bldg., Camden, N. J. A limited number of copies of said drawings and specifications will be loaned to prospective bidders, for the purpose of estimating on deposit of a certified check to the Architect's order in the amount of $25.00. If plans and specifications are returned to the Architect, within a reasonable time, and an estimate submitted, the check will be returned in full. Should plans and specifications not be returned nor an estimate submitted the deposit may be forfeited.

E. J. Frey,
Chairman, Bldg., Committee,

ARNOLD H. MOSES,
Architect.

Dated November 30th, 1926.

(Continued from page 792)

have learned riveting will stand the stress of weights and loads, the pull of movement and vibration.

America astounded the architects of the world back in the 80's by establishing a new school of architecture—the skyscraper. By means of these riveted steel columns rising tier upon tier to tremendous heights the real estate values of cities were trebled and the lives of multitudes made safe.

The dependability of riveting and its contribution to the progress and safety of humanity are reflected in every direction.

There is a field of usefulness for both welding and riveting. The dependability of riveting and its contribution to engineering progress are reflected in every direction and mere claims and propaganda for a radically different new method will not supplant it. Riveting is fundamentally sound, has played a very important part in the development of our most important industries and will only be supplanted by methods more economical, less dependent on skilled labor and assuring equal safety.

The conservation of human life and limb is a solemn duty not to be influenced by possible economies promised for a new method. The much discussed din of the riveting hammer is preferable to the possible loss of human life and property damage.

We are not opposing welding for it has a very useful field. In the interest of public safety we object to its improper and indiscriminate use.

The survey report on economics of short lengths in building lumber, prepared by the construction sub-committee of the National Committee on Wood Utilization of which Secretary of Commerce Herbert Hoover is the chairman, has been received from the Government Printing Office in galley form, and will

GENERAL INSURANCE | SMITH-AUSTERMUHL CO. 5th and Market Streets, Camden, N. J. BELL PHONE, CAMDEN 3210 KEYSTONE, CAMDEN 3147 | SURETY BONDS

probably be ready for distribution about January 1.

The report shows that for the buildings studied (various types of dwellings and barns and other farm structures) 20 per cent. of the lumber bill as an average could have been taken off the plans in lengths of 1 to 7 feet, though in the actual bills only 1½ per cent. of this was listed and mostly 7-foot. Following publication of the report a campaign of education will be inaugurated to get short lumber properly included in building lumber bills, as this is the first step to getting it actually ordered and used. It may be that the bidding lumber merchant may not have the specified short lengths and will figure them back into longer multiple lengths; but the lower price at which he can buy the short lengths will gradually bring about their actual stocking. With lumber properly listed in the bill the right way will become the easiest way.

Even before its publication the report has already been responsible for one notable step in this direction. A letter has been received from Findley M. Torrence stating that the Ohio Association of Retail Lumber Dealers of which he is the secretary, and which has a strong architectural department, has already started to refigure for its considerable series of house plans all the lumber bills to include the short odd-length material that the plans will take.

"We are inclined to feel," says Mr. Torrence, "that this method of approaching the problem . . will ultimately bring about the desired economics. We expect though to encounter some resistance at the outset." Any retailers however can readily convert the short lengths into long-length equivalents if necessary; while if the short lengths are not properly taken off the plans it is impossible to do more than guess how much or in what assortment the plan might take.

It must be a rather sound gospel that makes converts before there is opportunity to hear it. In this instance however much of the work of the architectural department of the Ohio Association is done by the lumber students at Antioch College, Yellow Springs, Ohio; and these same students, under supervision of Theodore F. Laist, its director of research in lumber retailing, assisted in the large amount of survey work which went into the short lengths report.

A supplementary report on end-matched short building lumber is in preparation as it is recognized that this offers even greater economies than the use of ordinary short lumber; and it is believed these economies will eventually bring it into use for all matched patterns, such as ceiling, drop siding and even sheathing and sub-flooring, in addition to the finish flooring where it first appeared in softwoods.

LUMBER IN THE WAKE OF TWO HURRICANES

BY E. MARK FERREE

The Southern Pine Association

There are many kinds of buildings, various methods of construction and a diversified array of building materials. Man made tests too numerous to mention have been taken in a thousand and one respective instances, but it is safe to say, that no one test has been common to all, and this has stood where that has failed.

Only by following in the wake of two hurricanes, each of the terrific velocity of more than 130 miles an hour, sparing nothing of the vicious and ever constant torment of their untold strength, can a true and impartial opinion of the hardiness of the subjected area be arrived at.

Wood, age old as a successful building material, has stood the acid test.

Following through from New Orleans, a city of staunch building proportions, to Pensacola, Fla., subjected to the disastrous tropical hurricane of September 18, to West Palm Beach, Hollywood and the Miami area, on to Key West, Havana and interior Cuba, just now lifting their bleeding heads from a terrific twister of October 20, rivaling only that which swept South Florida, a good idea has been gained of the type of building which still stands. Throughout the zones of both storms it was found that the buildings best withstanding were of a common type of wood frame construction.

However startling this statement may seem when thought is given to historic Havana where lumber construction has been barred by its building code over a period of years, and the weather beaten and thatched interior of Cuba, it nevertheless is true, as the impartial observer can see.

At New Orleans where hurricanes and tropical storms of varying intensities have been far from uncommon during its more than 208 historic years, even an eye unpracticed in judging the best in building methods can detect a staunchness and strength which gives security. Pine frame construction is seen at every hand, not only including a majority of the homes, but warehouses and business buildings of one, two and three stories in height. To the casual visitor the city lends an atmosphere of security and soundness, although in many cases the exact cause must be totally unsuspected. The one outstanding reason is that the city stands as a tribute to thorough building methods and an unlimited use of wood.

Morgan D. E. Hite, a widely known architect of New Orleans, points out in an article on the disastrous hurricane damage in Florida that the city has been built throughout its years under the stress and fear of impending storms, and that as a result a definite type of home building which is safe and proved has been designed and become universal throughout the Mississippi Gulf Coast.

This is the pine frame thoroughly bolted, braced, bridged, nailed and spiked strutted, being made as snug as possible, Mr. Hite says.

Seeking to follow in the wake of the hurricane at Pensacola, a scant two weeks after the visitation of a wind velocity reaching a height of 152 miles an hour and lasting for more than five hours, little or no damage could be found in the city proper, while in the outlying sections homes were in good condition with only here and there a weakly built shack or shed down. Of course, Pensacola's docks in many places were washed out due to high waters, and many waterfront shacks were razed, but this was of little consequence when compared to the well built structures throughout the area which stood.

C. H. Turner, a widely known contractor of Pensacola, estimated that 80 per cent. of the city's homes are built of wood and like New Orleans, it has been built in constant knowledge that hurricanes and severe storms are an ever constant menace to life and property. Therefore, Mr. Turner said, the construction in general is of the best, wind braced and shuttered. He pointed out with pride the fact that of probably 10,000 houses in the city 8,000 are of pine frame construction and many have stood through hurricanes over a period of years.

Mr. Turner cited the construction of approximately 75 to 100 houses in the past, and all were of frame design. In many cases, he said, they had been finished in veneer brick or stucco, but that primarily they are of wood.

Walker D. Willis, a Pensacola architect, concurred with Mr. Turner in his views of wood construction in Pensacola as did C. L. Griffin and John Massey of the Pensacola Home and Savings Association, a prominent building and loan company. All pointed to good construction and the use of wood in accounting for the remarkable manner in which their city has stood in the face of the hurricane.

Pensacola stands today as a monument to thorough building methods while her sister cities made up largely of other materials are even yet counting their losses.

On through Florida and down the East Coast to West Palm Beach it was found that in every city builders of all lines were taking inventory of not what had failed, but that which has stood. With pride they pointed to lumber houses ten, thirty and often fifty years old intact while on many sides were the ruins of later companions of the "new age" and of new materials.

Arriving in West Palm Beach on the morning of October 21, the town was found in absolute barricade for during the night side wind had been felt of the storm which had swept Havana and Cuba the day before. The residents were taking no chances, casting their eyes a few scant miles southward and seeing the Miami area slowly rising from the ruins of the hurricane only a month previous.

Here begins much of the shoddy construction which resulted in such a heavy toll at Miami, and West Palm Beach was taking no chances. During the night many had gathered in buildings known to be well built. One man told of housing 16 persons in his home which was of pine frame construction and had been built for 29 years.

Buildings and homes of West Palm Beach suffered little or no damage from either hurricane for they were not in the direct paths, but many of the residents lived in fear for they did not find confidence in the homes and buildings of a common type which had failed so miserably at Miami. Several contractors and architects interviewed said that from studies of the Miami situation the wood construction of their city probably would have stood where buildings of other types would have failed had they been hit.

Much already has been written of the storm torn path from a few miles south of West Palm Beach to Miami, but looking over the building situation here in comparison with other parts subjected to the storm and still intact, it is found that the wood frame type was almost entirely lacking, but the few sterling examples of its true worth are still to be seen. Ruins and wreckage are to be seen at every hand, but here and there, dotting the landscape in pleasant relief, stands a wood home or building.

Stories, too numerous to attempt to tell, are related by persons throughout the devastated district. They run in a single channel, in that nearly every one points to the fact that this house or that building housed so many at the height of the storm while on all sides other buildings crashed, lives were lost and damage great. Excepting some of the large hotels and business structures, the buildings referred to were of lumber.

Hollywood, Hallandale and Dania are arising from the ruins and rebuilding. In many cases residents are replacing their homes by tattered parcels of what was, but at the same time others are taking heed of the past and are rebuilding in wood.

At Miami a great deal of the storm damage has been eradicated, but here as in the rest of the area are seen wood structures towering over empty spaces or ruins where formerly stood pretentious neighboring homes.

The lumber dealers of Miami have taken time by the forelock and with the help of the Southern Pine Association are erecting a model home of frame construction. It is being designed to resist hurricanes and severe storms, and will be built in connection with an extensive educational campaign being conducted throughout Florida by the Southern Pine Association.

The lumbermen are being assisted by Miami architects and contractors, and are taking timely advantage of the lessons in construction learned from the hurricane.

In Miami as elsewhere stories of heroic homes and buildings saving the lives and possessions of hundreds of persons are rampant. In almost every case it is found that these are homes in the old parts of the city. Homes erected years ago, and of wood construction thoroughly built.

From Miami to Key West, a typical hurricane city in that it is built to withstand the worst in severe winds and storms, little damage was found. Of course this area was not subjected to the strongest of the winds, and there are few residents or buildings within its limits, verging upon the Florida Everglades. However, Key West, which the day before had experienced a wind velocity of more than 100 miles an hour, was found in excellent condition with nothing to indicate hurricane winds except the almost complete shuttering of windows and doors.

Here one finds practically nothing but pine frame construction, staunch and sturdy from the first. Homes and business buildings are of a common type of wood. Thorough bracing, strutting and shuttering are seen on every hand. Key West is not taking a mournful toll of life and property today.

It is the southermost city of the United States, and is a strategic point in the defense of the country. The government sets an excellent example in its construction of numerous buildings there—all of wood frame. The Key West Naval Station is the scene of universal wood construction.

From a city of wood to a city of stone —Key West to Havana. Here the building code bars the use of wood, but today broken cornices are being replaced, gutted walls are being rebuilt, shattered roofs are being repaired while out on the hills away from the city real estate subdivisions built much in the same manner as those of Miami barring the use of wood, are lying devastated, a total loss. In these places there was no wood construction and very little of stone as in Havana.

The city of Havana did not suffer greatly from a building standpoint. In all fairness, it must be said that the massive solid stone architecture of which it is almost entirely built is standing unscathed today. Walls are of great thickness, the buildings have been erected with the utmost time and care.

But looking from the Havana of stone to the Havana of wood. The latter truly is a small part, but it stands proudly intact—as much as its brother of stone. The Havana of Wood includes the ancient parts of the city which have been settled for years back.

Out from the city once again are heard stories of heroic buildings, for a good building sheltering lives and property in the teeth of a 150 mile gale is truly heroic. Fred M. De Stefano, a member of the staff of Jose Emilio Obregon, son-in-law of President Machado, and director of the Presidential Palace, related with pride the story of his home in Mariano just out of Havana. It is built of pine frame of the old school of construction and stands today in the midst of ruins of other types. Mr. Stefano was profuse in his praise of wood construction and said that he considered his home safe to other structures appearing and purported to be of greater strength.

On into the interior of Cuba down to the Batabano on the South Coast one finds varying types of buildings ranging from dirt and thatch huts to frame and stone buildings of more pretentious character. Here is where the great damage and loss of life was wrought by the hurricane. The country spaces were laid waste and the flimsy homes and buildings were razed. But even here some homes and the few buildings of wood are seen standing.

At Batabano the story is told of a single house with 32 persons in it being carried more than 200 feet, but holding together and safeguarding the entire company.

Such examples could be carried on at length, but the lone and outstanding fact would force itself above all others—wood construction has stood in the face of two of the most disastrus hurricanes ever known when other building materials have not.

THE VALUE OF HOLLOW AIR SPACE INSULATION IN MASONRY WALL CONSTRUCTION VERSUS PAR-LOCK SIDE WALL PLASTERING

BY MAJOR M. B. CARSON

The value of insulation of the hollow air space in masonry wall construction, developed by wall or furred tile, placed with webs perpendicular or horizontal, has ofttimes been disputed.

Its efficiency has been originally based on the assumption that if an air space was positively tight, that the dead air would prove a direct resistance of cold or heat.

Assuming this theory to be correct, long experience and close investigation of wall conditions have proven that there is always present sufficient wall leakage to render the air space active and in more or less circulation rather than dead.

The web marking of tile, when plastered direct without a dampproofing course, has shown an effect of conductivity producing condensation that has been misconstrued to mean a loss of heat at the web points greater than that developed through the air space of the tile.

This feature has caused some builders to set furring tile away from the main wall, so as to produce an unbroken air space between the tile and the masonry wall. This tends to reduce an effect of tile marking but does not lessen the loss of heat.

A recent publication by The Honorary Advisory Council for Scientific and Industrial Research, of the Dominion of Canada, shows the passage of British Thermal Units per degree per hour per square foot to be

"A"—8 inch solid masonry side wall construction, built of hard burned common bricks was .397 B.T.U.'s.

"B"—8 inch hollow tile wall with flues placed vertical unplastered was .416 B. T.U.'s.

"C"—The same as "B" only with the air space filled with dry gravel was .355 B.T.U.'s.

The above findings were from a series of determinations made to prove the "TRUTH" regarding the efficiency in the air space. Note that when the flue was filled with gravel, thus confining the air space to small and much broken compartments interrupting circulation, in a manner similar to air space in cork insulation boards, the transmission was immediately lowered, proving also that greater transmission was through the air space in the flue, than through the web or solid sections.

Having established these facts, other tests on 12 inch tile were made as shown below.

"A"—12 inch tile with flues laid horizontal was .295 B.T.U.'s

"B"—12 inch tile wall as above, with a heavy coating of asphalt paint on the high temperature side of the wall was .206 B. T. U.'s

"C"—12 inch tile wall as above, plastered on both sides, plaster being 5-8 inch thick was .179 B.T.U.'s.

Considering the difference in the thermal conductivity as shown in "A" and "B" walls, the loss of heat through a 12 inch solid brick surface, dampproofed and plastered, would have shown less than that shown on the tests developed on 12 inch tile.

On page twenty-six of this issue the following is observed.

"FIRST"—The term "DEAD AIR SPACE" is a misnomer in ordinary building construction. If an air space is wide enough to permit air to circulate within it, the effect will be to assist the inside heat to escape to the outside shell of the wall.

"SECOND"—This movement of air takes place in nearly all of the commonly used types of hollow wall construction, whether they be of individual, hollow blocks or thin monolithic walls cast with a space between them.

In comparing the insulation qualities of Par-Lock plastering on solid brick, masonry or concrete walls let us consider the interior structural surface of an exterior wall to be covered with a coating of asphalt for dampproofing purposes. The characteristic of the asphalt when properly applied, will prevent any ingress or egress of air through the structural wall. This condition being present the air which is confined in the structural wall itself instead of passing through the wall (which it would do if the asphalt on the interior face of the walls were not present) remains trapped in the wall and causes a section of the wall next to the asphalt coating to function in a much higher state of insulation than when air filtration is permitted.

Shortly after the last course of asphalt has been applied by air pressure through the Par-Lock Gun, the grit or plaster key is blown into the still plastic asphalt and the whole allowed to set up for at least three days. When the grit is applied it is not forced through the coating of asphalt but is merely imbedded in it so that no particle of grit comes in contact with the structural surface. After the plaster has been applied to this Key, the Key, and the plaster are separated from the structural surface of the interior wall by an unbroken sheet of pure asphalt, the properties of which produce the desired dampproofing and air sealing effect. The positively air sealed surface and the suction produced by the dry grit develops the highest crystallization in the plaster and causes it to dry out, bone dry and remain so. This produces plaster that is permanently functioning at its highest value in insulation.

Thus, although Par-Lock in itself cannot be considered of any material insulating value, it develops, in combination with masonry or concrete structural bodies and Gypsum Plaster the highest state of insulation to be produced with these materials.

From the preceding it will be seen that a solid brick wall insulated and protected in the manner produced by the Par-Lock method, is the warmest type of wall. This we consider has been adequately proven by the number of different characters of buildings which have been plastered in this manner, over different types of solid side wall construction, from San Francisco to Boston, and throughout the humid districts of the United States. These walls remain free from condensation, and many of them have delicately shaded decorations. The destructive effect that condensation would have on them has not been observed.

It should be further considered that the labor and part of the material in applying the scratch coat of plaster is saved.

Now, the chief features that are accomplished in using Par-Lock plastering on side walls are as follows:

Walls that will produce the greatest possible saving in the coal pile being and remaining positively tight, eliminating the filtration of air or moisture.

A longer life of the decorative coatings that will remain free from stain, discoloration, the breaking down caused by condensation, the infiltration of air or moisture against the back of the decorations.

Plaster materials, carbonized and crystallized to their fullest strength. When hydrated lime is used for finish it is hydrated after application so thoroughly that popping and peeling of the finish coat is eliminated.

For the first time in the history of the construction industry the advent of winter is seeing an increase in the volume of construction operations. So great was the activity last month that a new record for November was set, according to statistics compiled by the Associated General Contractors of America.

By registering a marked increase over the October figure, the volume of activities in November approached the high mid-summer levels. The most recent developments place 1926 well ahead of 1925, when all previous records for volume of construction under way were broken. The first 11 months of the current year register a volume almost 2 per cent. greater than that recorded during the corresponding period of 1925.

An index based upon the 1913 average as 100 shows the November volume to have reached the 210 level, an increase of 10 points over October. In other terms, November showed an increase of 5 per cent. over the volume of work under way in the preceding month.

In 1925 a decline of seven points was recorded for November. This was in accordance with the long prevalent tendency of construction operations to slow down with the opening of winter.

The unusual condition this year is attributed to the irresistible demand for construction which has been felt throughout the year and to the effects of earnest efforts to wipe out ineconomies resulting from short building seasons.

Indemnity Insurance Company of North America write practically every form of Insurance, except life

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

Lehn & Fink Building, Bloomfield, N. J. Buchman & Kahn, Archts. Chas. R. Hedden Co., Contrs.

This entire building was constructed between November and February with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water, making it possible to continue concreting, cementing and masonry work during freezing weather, instead of shutting down the job with a loss of valuable time and costly delays.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also permanently hardens and waterproofs concrete all in one operation. It mixes readily with the gauging water without the aid of skilled labor.

During 22 years of continuous use "ANTI-HYDRO" has never failed to live up to the claims made for it. Satisfactory results are guaranteed. Use it on your next job.

As The Editor Sees It

MERRY CHRISTMAS! We utter the time-worn phrase so gibly, and often without any thought of its real significance. How little we realize all that Christ's birthday really means to us. The great Christmas sentiment of kindness and love for our fellow men is expressed by our gifts to one another or still better by acts of service and charity.

Whether we profess belief in Christianity or not, there are very few of us who would choose to live in a country or community untouched by the influence of Christianity; and all that we hold dearest and best in our own great country is an outgrowth of Christ's principles and teachings; the very framework of this great republic is based on Christianity. All our policies of freedom, equality, and justice were first taught by the great teacher. There have been many other great prophets and teachers, but the only utterly unselfish doctrine ever taught was that of Christ.

As we look forward we can prophesy another year of good business and prosperity. The boom times in the building game have probably passed, but all indications are for a continuation of satisfactory business conditions.

Let every man examine his conscience and determine whether he is applying the Golden Rule of Christianity to his business, for in so doing he will merit not only material success and prosperity, but a great moral and spiritual satisfaction, and not until then can he realize to the fullest extent the great portent of our Merry Christmas.

Construction costs are holding fast to the low level they assumed last August. The average of these costs for the past four months is the lowest recorded during any similar period since March, 1923, according to statistics compiled by the Associated General Contractors of America.

While a slight increase was noted during November, the change merely brought the cost average back to the position it occupied in July and August before dropping a trifle in October to reach the lowest point in two and one-half years.

The rise noted during November was the reflection of a small margin of increase shown in the prices paid for sand, gravel, stone and common brick in several sections of the country.

The November average occupied the 196 level on a scale which places the 1913 average at 100. The October mark was 195. At no time during 1926 has the average risen above the 200 level, a mark which was reached or exceeded in seven of the months last year.

The average of wages paid the building trades in the principal construction centers remained unchanged during November. Wages have held virtually one level since last May, when they reached the record-breaking point of 228 on a scale based on the 1913 average as 100. The November mark was 225.

The average of prices paid for construction materials occupied the 176 mark at the beginning of the current month.

Approaching weeks will witness the greatest volume of mid-winter construction operations ever undertaken in the United States. This is the conclusion drawn by the Associated General Contractors of America from a series of statistical studies just completed

The prediction of intensive building activities is based largely upon the fact that the record-breaking demand for new construction gives small indication of diminishing. The latest statistics show this demand to have been so great last month that a new November record was

hung up.

Direct evidence that a vast amount of building is ready and anxious to get under way is being offered. The volume of contracts awarded during the first 10 months of 1926 is 8 per cent. greater than the total for the corresponding period of 1925. The volume of construction actually undertaken in 11 months this year is approximately 2 per cent. greater than the volume registered in the same portion of 1925. Thus, it is pointed out, a vast margin of contracts awarded has been built up during the year and represents proposed activities which will get under way at the earliest convenient time.

The volume of building permits issued during October showed an amazing increase over the previous month, reaching the greatest proportions registered in any single month this year. October also saw the establishment of a new record for awards of contracts in that month.

The following ideas of some standard specifications for contractors was submitted to us as interesting reading, and we pass this along to our readers so they too may have a laugh. An experienced, successful contractor, one that has done work of no small proportions is author of the suggestions entitled, "Standard Specifications for Contractors."

STANDARD SPECIFICATIONS FOR CONTRACTORS

General Conditions

INTERPRETATION: The plans and specifications are to be taken together. Anything shown on the plans and not mentioned in the specifications and anything mentioned in the specifications and not shown on the plans, is to be considered as both shown and specified, and anything wanted by the architect or any of his friends, or by anybody else (except the contractor) shall be considered as shown, specified, implied and required, and shall be provided by the Contractor without expense to anybody but himself.

If the work has been done without expense to the contractor, the work shall be taken down and done over again until the expense is satisfactory to the architects.

ARCHITECT: The term "Architect" herein appearing, shall be understood to mean the architect or any uncivil and unsanitary engineer that he may foolishly employ to assist in making trouble for the contractor.

PLANS: The plans are to be considered diagrammatic and disgraceful and are to be followed only where space conditions make it possible to avoid doing so.

Coincidence between plans and executed work shall not be considered a claim for extra compensation. The architect is not required to recognize coincidence.

Anything that is right on the plans is to be considered right. Anything that is wrong on the plans shall be discovered by the contractor and shall be made right without telling on the architect or indicating it in the bills.

Anything that is forgotten or left out of the plans and specifications, but which is necessary and required for the comfort and convenience of the owner, whether he thought of it before or after the execution of the contract, shall be provided by the contractor to the satisfaction of everybody (but the contractor) and in full accord with the evident intent and meaning of the specifications, without extra cost to anybody but the contractor.

RULES AND REGULATIONS: The work throughout shall comply with all rules, regulations, caprices and whims of all City, County, State, National and International Departments, Bureaus and Officials having or not having jurisdiction.

MATERIALS: All material shall be the best of their several kinds and the contractor is expected to know and provide the best, irrespective of what is specified in detail.

The architect reserves the right to change his mind about what is the best.

Any changes necessary to make the work and material fit to the minds of the architects, shall be made by the contractor without extra cost.

PERMITS: The contractor shall obtain all permits and shall pay all fees, annual dues, assessments, subscriptions to masked balls, organizations, outings and for all hat checks.

DAMAGE: Any damage done by the contractor shall be paid for by the contractor as liquidated damages and not as a penalty.

GUARANTEE: The contractor shall guarantee, and hereby does guarantee that he will keep in complete and perfect working order anything that the architect asks him to, as long as there is more work in sight in the architect's office.

ARBITER: In case of any dispute arising as to the nature, character or extent of work, shown, specified, or implied, the matter shall be decided by referendum

Stone, cut stone, limestone, 2½ stories and basement, 83x43, vermont slate roof, cement, oak and pine floors, painting and glazing, hot water heat, electric light, metal lath, tile work, bond, ornamental iron work, flagstone. Contract awarded J. Howard Roberts, Landsdowne, Pa.

Gymnasium Building, Indiana, Pa. Architects, Lawrie & Green, 116 Locust street, Harrisburg, Pa. Owners, Indiana State Normal School, care of William Keith, Indiana, Pa. Brick, reinforced concrete, cut stone, limestone, steel, 2 stories and basement, 168x68 feet (plumbing, heating, electric separate), built-up and black slate roof, cement and maple floors, hollow tile, waterproofing, ornamental iron ,iron stairs, bond, rolled steel sash and skylights. Contract awarded to Columbia Const. Co., Altoona, Pa. Plumbing to E. R. Lumsden, Indiana, Pa. Heating to William M. Clark & Co., New Castle, Pa. Electric to John W. Spangle & Son, Swissvale, Pa.

J. Horace Landis Public and High School, Schwenkville, Pa, Architect, C. J. Lappley, Parkside Building, Harrisburg, Pa. Owners, School District, Lower Frederick Township, W .S. Brey, Schwenkville, Pa. Fireproof, 1 story, 17 class rooms, gymnasium and auditorium, slag roof, composition floors, hollow tile, safety treads, roof ventilators. Contract awarded to J. S. Foose, Harrisburg, Pa., $72,897.43. Plumbing to M. H. Baker, 1330 Derry street, Harrisburg, $4,960. Heating to J. M. O'Donnell, Quakertown, Pa., $15,563. Electric to D. L. Bradley, Norristown, Pa., $3,727.84.

School, Swarthmore, Pa. Architects, Ritter & Shay, Packard Building, Philadelphia. Owners, School District of Delaware County, L. A. Perry, Swarthmore, Pa. Contract awarded N. W. Bryan, 10 South Eighteenth street, Philadelphia, $115,450. Electric, Merit Elec. Co., 630 Race street, Philadelphia, $5,500. Plumbing, Bulman Brothers, Fifth and Cumberland streets, Philadelphia, $5,353. Heating, American Heating & Ventilating Co., 1505 Race street, Philadelphia, $24,679.

Hotel, Stores and Offices, West Ninth street, Chester, Pa., $1,200,000. Architect, private plans. Owner, care of builders. Steel, concrete, limestone, terra cotta, 8 stories and basement, 114x112 feet, tile roof, electric light. Plans about completed. Will be ready for sub. bids in ten days. Contract awarded Ell Dee Const. Co., L. Davidson, 519 Market street, Chester, and Franklin Trust Building, Philadelphia.

Stores and Lodge Rooms, Shenandoah, Pa. Architect, J .B. Thompson, 34 South Seventeenth street, Philadelphia, Owners, Loyal Order of Moose, No. 1179, Shenandoah, Pa. Frame, stucco, 3 stories, hot water heat, electric light, tile and marble work, plate glass, metal ceilings, structural steel, copper bulks. Contract awarded Francis McGraw, Shenandoah, Pa.

Hospital (add. and alts.), Wernersville, Pa. Architect, George H. Boyer, Lebanon, Pa. Owners, Board of Directors, Dr. S. Hill, superintendent, Wernersville, Pa. Brick, hollow metal doors and partitions, cut stone, waterproofing. Contract awarded to Adam Spatz, Wernersville, Pa.

Church (rebuilding), Sinking Springs, Pa. Architects, Ritcher & Eiler, 147 North Fifth street, Reading, Pa. Owners, St. John's Reformed Church, G. R. Reber, secretary, 123 Woodrow avenue, Sinking Springs, Pa. Brick, 1 story, 46x65 feet, slate roof, pine floors, electric light, metal lath (heating reserved). Contract awarded to C. H. Schlegel, 528 Washington street, Reading, Pa.

Store (add, and alts.), 1140 Perkiomen avenue, Reading, Pa. Architect, H. R. Heckman, Baer Building, Reading, Pa. Owner, Louis Goldblatt, 1001 Penn street, Reading, Pa. Cinder block, 1 story, 12x25 feet, composition roof, yellow pine floors, heating extension, electric work, tile and marble. Contract awarded to Louis Heilbron ,19 South Tenth street, Reading, Pa.

Building, Doylestown, Pa. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Derk Mfg. Co., Doylestown, Pa. Contract on heating awarded to J. P. Smith, 138 North Seventh street, Philadelphia, Pa.

New Jersey Construction News

Department Store (alts. and adds.), 129-33 E. Front St., Plainfield, N. J. Architect, Sol. Kaplan, 10 S. 18th St., Phila. Owner, name withheld. Building block, 1 story 40x40 feet, general alterations to present building. Plans in progress.

Ice Plant, Ocean City, N. J. Architect, private plans. Owners, American Ice Co., City Center Bldg., Phila. Brick, steel, 1 story, 35x100 feet, 30x50 feet, slag roof, cement floors, ornamental iron work. Owner taking bids due Dec. 30th.

Post Office, Millville, N. J., $90,000. Architect, James A. Wetmore, Treasury Department, Washington, D. C. Owners, United States Government, Treasury Department, Washington, D. C. Brick and stone. Plans in progress.

Hotel and Restaurant Building, North Atlantic City, N. J. Architects, George B. Post & Sons, 101 Park avenue, New York. Owners, Childs Co., 200 Fifth avenue, New York. Brick, limestone, 18 stories, 250x110 feet. Plans in progress. Ready for bids in about four weeks.

Store (alts.), Academy and Broad streets, Trenton, N. J. Architects, W .W. Slack &

Son, Trenton Trust Building, Trenton, N. J. Owner, Manuel New, Wilmeta Apartments, Trenton, N. J. Vapor heat, elevators, plumbing, plate glass, copper work. Plans in progress.

Lodge Building, Pearl street and Warren street, Bridgeton, N. J. Architect, Thomas Edward Ash, 1700 Walnut street, Philadelphia. Owners, Aerie No. 1579, F. O. O. E., G. A. McKeen, Bridgeton, N. J. Architect taking bids due December 29th.

Residence, Trenton, N. J. Architects, W. W. Slack & Son, Trenton Trust Building, Trenton, N. J. Owner, K. G. Dresdner, Cadwalader Apartments, Trenton, N. J. Hollow tile, stucco, 2½ stories, 20x70 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Architects taking bids due December 23rd.

Auto Sales Building, Southwest side Haddon avenue, Northwest Copewood street, Camden, N. J. Architect, C. E. Wunder, 1520 Locust street, Philadelphia. Owner, Paul M. Evans ,Camden, N. J. Brick, 1 story and basement, slag roof, cement floors. Architect taking bids due December 29th.

Amusement Park, Pier and Convention Hall, Ocean avenue, Sunset avenue, Asbury Park, N. J. Associate architects, Warren and Wetmore, Ernest A. Arend, A. F. Cottrell and Kenneth MacM. Cowner, 16 East Forty-seventh street, New York. Owners, Board of Commissioners, care of A. Grace King, 710 Bangs avenue, Asbury Park, N. J. Deposit, $150. Refund, $50. Certified check, 2 per cent. Owners taking bids due January 11th, 10 A. M.

Bridge, across South River, near May's Landing, at M. P. 39.8, State Highway Route 14, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Concrete, structural steel, foundation excavation, 42 feet, roadway width 40 feet. Owners taking bids due December 27th at noon. Certified check, 10 per cent. Deposit, $10.

Road Work, New Jersey. Owners, State Highway Department, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J.

Route 7, Shark River Station Grade Crossing, Elimination Approaches, Route 7, Monmouth County. Excavation, borrow, cinder surface, gravel surface.

Route 14, Sec. 11A-12A-13A-16 and 17, Middletown Bridge to Estellville, Atlantic and Cape Ma yCounties. Excavation, double line reinforced concrete pavement, gravel surface. Owners taking bids due December 27th at noon. Deposit, $10. Certified check, 10 per cent.

Bridges (2), New Jersey (across North and South Channels of Shark River between Belmar and Avon at M. P. 75.8, State Highway Route 4). Owners, State Highway, Trenton, N. J. North Channel Bridge: 3 spans, 73 feet each, concrete, plate girders supported on concrete piers and abutments founded on wooden piles. One (1) 78-foot trunnion bascule span to be constructed at present time. Concrete excavation, piles, structural steel, reinforced concrete. Owners taking bids due December 27th at noon. Certified check, 10 per cent. Deposit, $10.

New Jersey Contracts Awarded

Residence, 382 Boyd St., Camden, N. J., $,8000. Architect, private plans. Owner, U. G. Peters, 2304 Federal St., Camden, N. J. Block, stucco, 1½ stories, 24x42 feet, asbestos shingle roof. hardwood and pine floors, steam heat, electric light. Contract awarded to Frank W. Shisler, 461 N. 38th St., Camden, N. J.

New Front, 307 Market St., Camden, N. J., $2,600. Architect, private plans. Owners, Cramer Realty Co., on premises. Brick, 2 stories. Contract awarded to John C. Gibson, 611 Bailey St., Camden, N. J.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Plate girder bridge over Passaic River on State Highway Route No. 12, Essex and Passaic Counties. Contract awarded to Northern Const. Co., 423 Amherst street, East Orange, N. J., $116,285.71. Storm water drain on Route 1 at Cranbury, Middlesex County. Contract awarded to Celentena & Wenland, Trenton, N. J., $30,764.80.

Miscellaneous Construction News

Parish House, Claymont, Del. Architect, R. C. Tindall, 914 Orange street, Wilmington, Del. Owners, Episcopal Church of the Ascension, Rev. Charles A. Rantz, Claymont, Del. Stone, 2 stories, 30x100 feet, shingle roof, hardwood floors, steam heat, electric light, tile work. Plans in progress.

Parish House, Claymont, Del. Architect, R. C. Tindall, 914 Orange street, Wilmington, Del. Owners, Methodist Episcopal Church, Rev. Hugh B. Kelso, Claymont, Del. Stone, 2½ stories, 40x70 feet, slate roof, hardwood floors, steam heat, electric light, tile work. Plans in progress.

Laundry, Second and Washington streets, Wilmington, Del. Architect, C .R. Hope, DuPont Building, Wilmington, Del. Owners, Associated Laundry, care of architect. Steel, concrete, brick, 4 stories and basement, 65x80 feet, Johns Manville roof, concrete floors, elevators, safety treads, waterproofing, dampproofing, iron stairs, fire doors, skylights, steel sash, metal lath, tile work, electric work. Architect taking revised bids.

High School, Wilmington, Del., $660,000. Architects, Guilbert & Betelle, Newark, Del. Owners, Delaware School Auxiliary Association ,Mr. Taylor, DuPont Building, Wilmington, Del. Fireproof, 2 stories, 250x150 feet, slag roof, maple floors, hollow tile, safety treads, roof ventilators, iron stairs, skylights, steel sash, eerrazzo work, tile work, metal lath (heating, plumbing and electric separate). Owners will build.

Community Garage (20 garages), Wilmington, Del., $4,000. Architect, private plans. Owner, S. Tobasso, Pennyhill, Del. Cinder block, 1 story, 96x20 feet, slag roof, concrete floors. Permit issued.

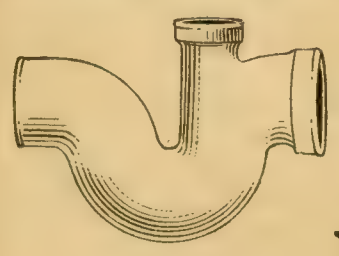
Bungalow, Arden, Del. Architects, Durham Brothers, 34 South Seventeenth street, Philadelphia. Owner, Mrs. Albert T. Hanby, 4620 Osage avenue, Philadelphia. Stone, 1 story, 30x50 feet, vulcanite roof, cement floors, electric light. Plans completed. Owner will take bids. (Note correct architects.)

Miscellaneous Contracts Awarded

Convent and Academy Building, Mt. St. Mary's on the Hudson, N. Y. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Sisters of the Order of St. Dominic, on premises. Brick, reinforced concrete, cut stone, limestone, steel, 5 stories and basement, 237x50 feet, wing 116x47 feet, wing 78x44 feet, built-up and variegated slate roof, cement, pine and maple floors, hollow tile, elevators, roof ventilators, metal window guards, metal weather strip, dampproofing, membrane waterproofing, metal lath, steam heat, electric light, tile, marble and terrazzo work, rolled steel and hollow metal sash, monitor skylights, tin-clad and kalamein doors, floor hardener, ornamental iron work, brass pipe, cast stone, steel casements, hollow metal partitions, Austial window hardware, caulking, mastic floors, dumb waiters, oil burning. Contract awarded F. A. O'Hare Co., 270 Madison avenue, New York.

Office (add.), Naugatuck, Conn. Architect, R. Brognard Okie, 306 South Smedley street, Philadelphia. Owner, Harris Whittemore, Naugatuck, Conn. Brick, stone. Contract awarded Tidewater Building Co., 16 East Thirty-third street, New York.

Proposal



ADVERTISEMENT FOR THE CONSTRUCTION OF A HIGH SCHOOL BUILDING AND ALTERATIONS TO THE PRESENT SCHOOL BUILDING FOR THE BOARD OF EDUCATION, MERCHANTVILLE, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip, ready for furniture, a High School building; adjacent to and connected with the present Public School Building, and to make alterations in present building, will be received by the Chairman of the Building Committee of the Board of Education of the Borough of Merchantville at the School Building on Tuesday, December 28th, 1926, at 8 o'clock P. M., at which time all proposals submitted will be publicly opened and read.

The High School Building, includes the School, and Auditorium building. It is to be constructed with concrete and brick walls with concrete floors supported on a structural steel frame with fireproof construction. The building contains approximately 520,000 cubic feet. The alterations to the present building consist of changes in basement and first floor, as shown on plans and as specified.

Said proposals must be on blank forms provided by the Architect for that purpose and must be enclosed in sealed envelopes endorsed "Proposals for Merchantville High School' and must state the branch of work for which the proposal is submitted.

No bid will be considered unless accompanied by a certified check to the amount of five (5%) percent of the bid, binding the bidder to execute a contract if awarded to him, and also a statement from a surety company that it will furnish the contractor with a bond for the full amount of his contract,

When you want Prompt Service, Intelligent Co-operation and Reliable

SEWER PIPE, FLUE LINING, WALL COPING

CALL—COLUMBIA 6526-6527. PARK 4981

William H. Clausen

27th and Diamond Streets, Philadelphia

binding the bidder to execute a contract if awarded to him.

The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is reserved to accept any or all bids submitted, also to waive any informality in the same.

Copies of the drawings and specifications will be on file at the office of the Architect, Mr. Arnold H. Moses, Temple Bldg., Camden, N. J. A limited number of copies of said drawings and specifications will be loaned to prospective bidders, for the purpose of estimating on deposit of a certified check to the Architect's order in the amount of $25.00. If plans and specifications are returned to the Architect, within a reasonable time, and an estimate submitted, the check will be returned in full. Should plans and specifications not be returned nor an estimate submitted the deposit may be forfeited.

E. J. Frey,
Chairman, Bldg., Committee,
ARNOLD H. MOSES,
Architect.

Dated November 30th, 1926.

(Continued from page 808)

and recall, after which the decision may be set aside and reversed by the architect.

PAYMENTS: Payments, if any, shall be made only on the architect's certificate. Architect's certificates shall not be considered negotiable nor are they legal tender. When once issued, the architect assumes no responsibility for their further usefulness.

Partial payments shall be made, as the work progresses, in the amount of 85% of the value of the work done, as judged by the architects.

In no cases shall the judgment of the architect cover more than enough to cover the pay roll every Saturday night. The material man must take the necessary chances.

The final payment (if any) shall be made only when everybody shall be satisfied (but the contractor.)

Any evidence of satisfaction on the part of the contractor shall be considered a just cause for withholding final payment.

FINALLY: The contractor shall accept and hereby does accept the conditions hereinbefore appearing for himself, his ancestors, and pregenitors, his family, his heirs, executors, his ox, and his ass and any stranger that is within his gates.

The national conference on the real estate mortgage bond business held under the auspices of the American Construction Council, at 120 Broadway, New York City, November 30th, with Hon. Franklin D. Roosevelt, President of the Council, presiding, and an attendance of over one hundred representative leaders of all component parts of the building industry as well as by state authorities, took action of far-reaching interest to the construction industry and the public.

The conference by resolution authorized a complete survey of the first real estate mortgage bond industry by a special committee of the American Construction Council headed by Mr. Roosevelt with instructions also to make recommendations and report back to a later meeting of the entire body to be called by the Council as soon as practicable, probably early in January, this committee to work in full co-operation with the securities commissioners of the various states. The other members of the committee, which has power to add to its members as the survey progresses are: Judge A. F. Murphy, President of the Federal Bond & Mortgage Co., Detroit; W. J. Moore, President of the American Bond & Mortgage Co., New York; A. Bryan Pitts, of F.H. Smith & Co., Wash., D. C.; S. W. Straus, President of S. W. Straus & Co., New York and Chicago; Edgar N. Greenebaum, Greenebaum Sons Investment Co., Chicago; J. M. Ulmer, of the Ohio Mortgage Bankers' Association, Cleveland; Edward Sonnenschein, of the Chicago Mortgage Bankers' Association, Chicago.

The committee immediately organized and started its work and will get in touch with all interested elements in its survey.

The resolution as passed by the conference authorizing this action was as follows:

> "*Resolved*, That the American Construction Council appoint a committee of seven representatives of the first mortgage real estate bond houses, of which committee Franklin Roosevelt, President of the American Construction Council, shall be the Chairman, this committee to survey the general condition of the real estate bond business and to co-operate in such survey with the committee of the Securities Commissioners of the several states, with power to add to its membership and to appoint sub-committees, and to report at a subsequent meeting of this body at the call of the chair."

This meeting was called following specific suggestions before the Council's annual convention in Cleveland on November 9th and while it was the sense of the conference that the real estate mortgage bond business is as sound as any other large industry in the country, it was felt such a survey should be made to maintain confidence on the part of the public in the industry and to further develop uniformity of sound practice in the industry itself.

Methods under which the record-breaking construction activities of 1926, involving expenditure of seven and one-half billion dollars, were carried on are soon to be reviewed by leading builders. This action will take place at a conference to be held at Asheville, N. C., January 24-27, under the auspices of the Associated General Contractors of America.

Prominent among the subjects to be discussed, announcement of the program for the meeting discloses, will be: surety bonding practices; awards of contracts to irresponsible or incapable bidders; lien law provisions; methods of financing construction operations; economics of highway construction; use of standard contracts; construction of public projects under the "day labor" system, and prevention of accidents.

"The intensive building activities of the year just concluded have hidden from view the effects of many conditions which would be more obvious in a less hectic period," Gen. R. C. Marshall, Jr., head of the conference's sponsoring group, declared. "While no immediate let-down of the furious pace of construction activities is in prospect, the return to a more normal volume of operations is certain to come.

"During the past six years, the construction industry has been busily engaged in meeting the demand for new buildings that was pent up during the war. Completion of the task of satisfying this demand will return the industry to the fulfillment of current needs as they arise.

"It is for the sake of preparedness against the time when every possible efficiency and economy will be increasingly vital to the building public that the forthcoming meeting is being called."

Leaders of the construction industry whose operations cover virtually every state and many foreign countries have been invited to attend the meeting.

A NEW USE FOR LIME

Hydrated lime as a filler in asphalt mixtures produces higher stability values

GENERAL INSURANCE | SMITH-AUSTERMUHL CO. 5th and Market Streets, Camden, N. J. BELL PHONE, CAMDEN 3210 KEYSTONE, CAMDEN 3147 | SURETY BONDS

than equivalent amounts of the more commonly used materials, investigations conducted over the last three years by Prevost Hubbard and F. C. Field, of the Asphalt Association, disclose. These investigations were instituted because a greater resistance to displacement is necessary in order that bituminous mixtures may successfully resist the stresses to which they are subjected by modern traffic.

The investigators went thoroughly into their work covering the entire field. They developed a highly satisfactory method of testing for stability asphalt briquettes, which might either be cored from pavements or prepared in the laboratory. Supplementary to their report they made the following statement:

"Recent investigations of methods of increasing and more closely controlling resistance to displacement of asphalt pavements under modern traffic have emphasized the very important stabilizing effect produced by mineral fillers as a constituent of paving mixtures.

"It has long been realized among paving engineers that fineness is a necessary characteristic of good fillers, but the effect of variations in fineness has never been thoroughly understood. Moreover, only a very limited number of types of finely divided substances have been used so far in paving practice.

"Among the little used products which are widely available in large quantities, hydrated lime gives promise of being particularly well adapted for use as a filler both on account of its extreme fineness and surface texture.

"It is believed that the research data secured relative to this material, coupled with practical results obtained where it has been used in actual construction, merits its favorable consideration by paving engineers in future work."

Summarized, the conclusions reached by the investigators based on their previous work and that presented in a bulletin by the National Lime Association entitled "The Value of Hydrated Lime as a Filler in Asphalt Paving Mixtures," are:

1. Hydrated lime is a more efficient stabilizing agent in asphalt paving mixtures than is the average limestone dust filler when used in the customary percentage of the total mix.

2. No difference in the stabilizing value of different limes can be attributed to differences in chemical composition, i. e., whether the lime is high calcium or high magnesium.

3. The maximum stabilizing and void reducing effect of hydrated lime in paving mixtures containing a well graded sand appear to be obtained by the use of approximately 15 per cent of lime.

4. In sheet asphalt paving mixtures with well graded sand it appears that about 13 per cent. by weight of hydrated lime is equivalent to 20 per cent. by weight of average limestone dust, and about 8 per cent. of lime is equivalent to 15 per cent. of limestone dust.

5. Hydrated lime appears to be better adapted for use with a relatively soft asphalt cement than is limestone dust, and when so used indications point to the production of mixtures of high stability at 140 degrees F. which are less likely to crack in cold weather.

6. Hydrated lime is an especially desirable filler for use with uniformly fine sand and its superiority to limestone dust for such use may make available for sheet asphalt construction, fine sands which are at present eliminated by specifications.

ECONOMICS APPLIED TO THE CONSTRUCTION INDUSTRY

By G. SZMAK, *Treasurer*
American Institute of Quantity Surveyors

While it is true that there is nothing new under the sun, yet during the march of human generations everything is learned, forgotten and re-learned. It is the duty of everyone to investigate, teach and learn the things affecting human welfare in order that the man of today can live as complete a life as the man of yesterday or that of tomorrow, even though the ways and means may be different. All matter and principles forever remain the same. One of the most important conditions having effect upon human welfare is shelter against the elements. The work to provide this shelter is invested in what is probably the greatest single industry of men and women, known as the Construction Industry. This industry is composed of the CONSTRUCTION DESIGNER, SURVEYOR and the CONSTRUCTOR and only when all three branches are intelligently utilized can the greatest efficiency, economy and durability result. The services and scope of these three absolutely essential branches of the Construction Industry are the subject in the continuation of this article, for the enlightenment and guidance of the prospective investor, purchaser or owner of Construction Work.

The Construction Designer

Whenever we contemplate to erect a structure of any sort, whether it is a large commercial building, a factory or a residence, if we act along the lines of proven efficiency the first thing we do is to secure the services of a competent Construction Designer, more generally known as the Architect. We have learned by example manifested through our own occupations that the man engaged in any particular calling is more fitted to be entrusted to do special work than if we were to do the work ourselves unaware of the principles of the work involved. The work of the Architect is to design artistically, economically and substantially, through a wise selection of materials and labor to be incorporated in his design, in such ratio as each characteristic may be required by the particular problem in hand. An Architect having fulfilled these requirements has done well his work. To expect him to do more would be to ask things beyond the scope of his profession. His work does not include the science of measuring and tabulating the quality and quantity of materials and labor required nor the efficient practical erection of a structure which are within the province of the Construction Surveyor and Builder.

The Construction Surveyor

As we study the causes of high cost in materials and production we realize more and more that to erect the designed structure economically it is necessary to enlist the aid of and know something of Economics.

"ECONOMICS IS THE SCIENCE OF CONSERVING ENERGY APPLIED TO TRANSFUSION, TRANSMUTATION AND TRANSPORTATION OF PHYSICAL AND SPIRITUAL MATTER."

The first essential principle of engineering is knowledge in the science of *measuring and tabulating the intensity and resistance of energy included and the space occupied by physical and spiritual matter;* thereby determining the exact extent it shall be necessary to apply or conserve energy in the process of transfusion, transmutation and transportation of the matter involved.

The branch of engineering which deals with the *intensity of energy—quality and space occupied—quantity of matter used in the erection of architectural and engineering structures is known as Construction Surveying*—sometimes called Quantity Surveying among the profession and some countries where it is practiced under such title. This branch of engineering is fast gaining in importance due to its high economic value in conserving energy—elminating waste matter.

"CONSTRUCTION SURVEYING IS THE SCIENCE OF MEASUREMENT AND TABULATION APPLIED TO THE PHYSICAL MEMBERS OF A STRUCTURE EXPRESSED IN UNIFORM UNITS OF MEASUREMENT WITH AN ANALYSIS AND DETAILED ACCOUNTING OF ITS REQUISITE *QUALITY* AND *QUANTITY* OF MATERIAL AND LABOR APPLICATIONS."

This is the only positive method of eliminating waste matter and thereby obtaining the greatest economic result or value compatible with the desired Quality, Quan-

tity and Price to be exchanged under the laws of Fair Competition. Persons engaged in the Construction Surveying profession are known as Construction and Building Surveyors and often-times as Quantity Surveyors, the former titles are more specific than the latter one and are therefore more generally recognized. The duties of the Construction Surveyor are well indicated by his title and the purpose of his profession is purely one of economics, i. e., the elimination of waste matter in the process of constructing architectural and engineering structures. It is not within the scope of his profession to design or erect a structure, this work is handled efficiently by the Architect and Constructor respectively. An experienced Surveyor can furnish information of great economic value to the Architect or his client in the efficient selection of materials and labor because he not only keeps posted on the relative cost of materials and labor but also has exact knowledge of what method in design of any given material will prove most economical to construct deducted from his past experience and analysis of the amount of material and labor required for any particular of various designs. Such information can be had before the design or plans and specifications are even started, although, it is most often through neglect determined after even the construction work has been completed and is too late for changes. Construction Surveys can be used on Lump Sum, Cost Plus Percentage, Unit Price or any other form of contract. The survey will in any case perform its economic function. The cost of designing structures is usually from 3 to 10 per cent. of its physical value and the fee for Construction Surveying is about 25 per cent. of the cost of designing. The amount paid to the Surveyor is saved several times over by the Survey through the elimination of waste. The Surveyor's fee may be paid direct by the Owner, incorporated within the fees of the Architect or may be specified to be included within the contract of the successful Constructor. The Surveyor may be employed direct by the Owner or his representative, the Architect or Designer. The process of having a Constructor or Quantity Survey prepared is simply to secure the services of a Surveyor upon the completion of the plans and specifications, prior to securing bids from the Constructors or Builders, and when ready it is furnished to the bidders along with the plans and specifications giving them an absolutely definite instrument of purchase; a complete plan with specific instructions and a survey expressing full intentions of purchase in structural dimensions, physical members in detail showing sizes, types, quality and quantity of materials and workmanship required to produce the desired structure.

Construction, Building or Quantity Surveys are now available throughout the United States and also in a number of foreign countries.

The Constructor

The third essential service in the process of erecting a structure is pretty generally known, that of employing a Constructor or Builder; the right selection of which is not so easy as it might seem at first. Whenever the purchaser does not provide the bidders with a positive Survey of his requirements they are compelled through the law of self-preservation to prepare their own surveys, in order to enable them to arrive at a basis for estimating the cost of the work involved. These surveys are prepared with more or less accuracy depending on the competency of the bidder and psychological effect produced upon him by his own intensity of desire to win, or fear of losing the work through supposedly unscrupulous methods of the other bidders. To prepare even a single bid for a structure it is necessary to make at least twenty-five to a hundred or more surveys for the various branches of work entering into the structure. When the number of bidders are ten or more and very seldom less than six it can readily be seen that there is a tremendous amount of duplicated effort involved in preparing surveys under a system where each bidder has to provide his own survey. This duplication of effort is not only very wasteful but it is absolutely unnecessary and is as ridiculous as if the purchaser requested ten or more architects to prepare plans and specifications for a structure and then the purchaser were to decide upon one plan which he preferred above the others and in turn were to furnish this plan to ten builders who would likewise erect ten structures from which the owner would select the one that he liked best and only made payment for one plan, specification and structure. Although the buyer apparently would be only paying for one plan, specifications and structure, all the eventual buyers would positively have to shoulder the expense created on the nine other plans, specifications and structures prepared for the first buyer, due to his inefficient mode of purchasing. This mistaken mode of purchase is in fact actually practiced by every buyer of Constrution Work, whenever they do not provide the bidder with a Construction Survey—a definite instrument of purchase. The selection of the Constructor or Builder without the use of a Construction Survey is positive gamble at best, inasmuch as all Fair Competition must be based upon three factors—Quality, Quantity and Price. The purchaser who has equipped himself with a definite instrument of purchase and has thereby positive knowledge of his requirements not only enables himself to purchase at a Fair Price but actually assists the Constructor or Builder to compete under the laws of Fair Competition, wherein he will gladly give a fair price on the requisite Quality and Quantity of materials and workmanship planned and specified without risk or fear of losing the Contract. Through the use of Construction Surveys all competitors are obliged to base their bids upon the same factors having control over Price—Quality and Quantity, which are otherwise left unknown to the Buyer. The work of the Constructor is not to design or survey a structure but to construct accurately and substantially. Some of the qualifications that are helpful in making an efficient selection of a Constructor or Builder are as follows:

1. Agreeability to conduct his business under sound and open methods in dealing with his clientele.

2. Knowledge of his personal integrity or that of the organizations with which he is associated.

3. Positive knowledge of his competency to correctly execute physically the design of the Architect, i. e., his ability judged by past performance.

These same recommendations are applicable also in the proper selection of the Construction Designer and the Construction Surveyor.

CAST STONE

Cast Stone has been used as a permanent building construction, for the past quarter of a century. Unlike marble, limestone or most of the sand stone, it shows no indication of weathering or disintegration. On the contrary its strength increases as time goes on.

Cast Stone has been used on the finest Churches, Banks, Schools, Office Buildings and every kind of building through out the country. It is not a local material but a natural product, and is now one of the leading industries of the building trades. Unlimited numbers of the best buildings in every section could be named where Cast Stone has been used; noteworthy examples being the New Stadium in Chicago and the new 12-story building for the Atlantic Refining Co. in Philadelphia, Pa.

Buildings with massive foundation blocks weighing two tons each to delicate tracery in Church windows weighing a few pounds are made by the Cast Stone Manufacturer.

The process of manufacturing consists of modeling, casting in forms, curing and dressing to the required size and shape with tools driven by Compressed Air or by other Machinery similar to those used for dressing the natural stone.

The Manufacturer is guided by Blue Prints in the Manufactures of Cast Stone

as there is no stock or Standard Shapes, each job being a development of the Architect's design.

Through scientific research, experience and educational work Cast Stone products are maintaining all tests required for them by all Building Codes.

A wall built out of Cast Stone is capable of sustaining a load many times greater than required by the Building Codes of any city. All Cast Stone made by the N. J. Art Stone Co. is reinforced by steel rods and shows greater tensile strength than natural limestone, granite, or marble. An official test made by the state of New Jersey and U. S. shows that our Cast Stone has a compressive value of 3750 pounds per square inch.

Marble, most of the sand stones and some of the Limestones are subject to disintegration as is evidenced in buildings of long duration. This kind of building material is disappearing and is being replaced with most satisfactory result by Cast Stone.

When granite or sand stone are hewn out of the rock 7/8 of the stone is wasted, this in connection with heavy freight rates makes building construction using these materials expensive. In cast stone there is no waste, the stone is made near the market, and for the most part forms the waste of natural material, hence enabling the Manufacturer to offer for lesser costs a strong durable building material. The material is permanently fire proof, and cheap because of moderate first cost and freedom from upkeep expenses. One ton of cast stone made into blocks 4 inches thick will face 47 sq. ft. of wall, using 2 inches thick it will cover 94 sq. ft. of wall which is far cheaper than bricks or terra-cotta product. The latter size is used on interior walls and presents a pleasing, artistic natural and smooth appearance, easily washed down with soap and water and not subject to stain or erosion.

Cast stone masonry offers a larger money's worth and insures a high re-sale value.

Every operation connected with Cast Stone is the result of scientific study, from the weighing and mixing of ingredients to placing the stone in the wall as an ornamental and substantial structure compiled by the originators of the principle of hardening concrete.

Cast Stone Finishes

There is practically no limit to the range and variety of beautiful finish which may be obtained in Cast Stone Reproduction of Granite (red or white), Sand Stone, Limestone, Traprock, etc., which is obtained by use of ground natural stone, marble or gravel and mineral coloring pigments, applied in a variety of combinations producing unlimited effect.

For the past five (5) years the New Jersey Art Stone Co., Inc., have been making Cast Stone at Vineland, N. J., furnishing some of the largest Churches, High Schools, Banks, etc., in the Philadelphia District, Pennsylvania and South Jersey.

The trade mark used by this Company is "NJASCO."

This year they have furnished over 200 tons for window tracery on two Churches in Philadelphia, with a complete output to date over 2000 tons.

Their method of making Cast Stone is based on over 20 years' experience in this specialized field of building construction, by the factory manager Mr. P. Bori, a sculptor and maker of Cast Stone in France, Italy and Germany for a period of 18 years and 5 here in Vineland, New Jersey, combining his foreign experience with the scientific progress of this business in the U. S. of America.

The New Jersey Art Stone Co., Inc., has acquired a tract of land on Malaga Road near the N. J.-Central R. R., has secured and built the necessary R. R. Sidings, and has erected a new building which will employ over 100 men and is equipped with all the necessary machinery and mechanical facilities suggested by the full experience in this business for a bigger and better production.

Indemnity Insurance Company of North America write practically every form of Insurance, except life

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

Lehn & Fink Building, Bloomfield, N. J. Buchman & Kahn, Archts. Chas. R. Hedden Co., Contrs.

This entire building was constructed between November and February with the aid of "ANTI-HYDRO."

"ANTI-HYDRO" lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water, making it possible to continue concreting, cementing and masonry work during freezing weather, instead of shutting down the job with a loss of valuable time and costly delays.

"ANTI-HYDRO" is an easy-to-use liquid integral compound which also permanently hardens and waterproofs concrete all in one operation. It mixes readily with the gauging water without the aid of skilled labor.

During 22 years of continuous use "ANTI-HYDRO" has never failed to live up to the claims made for it. Satisfactory results are guaranteed. Use it on your next job.

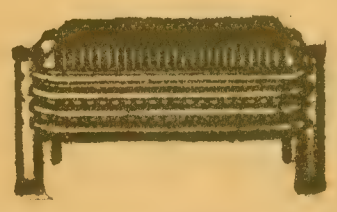
INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.



It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

As The Editor Sees It

DESTROYING PROSPERITY

By CHARLES JOHNSON POST

American Association for Scientific Taxation, Room 910, 15 Park Row, New York City

It may seem a far cry from the kind of business readers which this publication represents to farming. Whether farming is prosperous, or not, to farm taxes—or for that matter other taxes—may seem to have but little to do except with certain definite kinds of industry and manufacturing. In some peculiar cases this may be true.

But, when one considers the fact that, while there are only some 6,000,000 farmers in the country yet, when you consider their families of farmers and those dependant upon farm trade, there is a group of farm purchasing power that totals some 40,000,000 people. Rather large single group, is it not?

Is it not entirely apparent that all men of affairs simply as prudent, commonsense business men, must regard the farm situation and farm tax problems with serious attention.

For the farmer and his purchasing power are being taxed to his own death. Partly by himself and his own indifference to and ignorance of scientific taxation principles; but largely because the influential business men and business leaders and manufacturers are quite as indifferent to the principles and advocacy of scientific taxation as is the farmer.

Let me show you a graphic tabulation of the prosperity destroying load of unscientific taxation that the farmer, and all other business, too, are carrying. Look at this:

Percentage of Net Profits Paid Out in Taxes: Agriculture and Related Industries, State Taxes 64%, Federal Taxes 19%, Total Taxes 83%; Mining and Quarrying, State Taxes 44%, Federal Taxes 16%, Total Taxes 60%; Transportation and Public Utilities, State Taxes 28%, Federal Taxes 8% Total Taxes 36%; Construction, State Taxes 17%, Federal Taxes 15%, Total Taxes 32%; Finance, Banking and Insurance, State Taxes 22%, Federal Taxes 9%, Total Taxes 31%; Wholesale and Retail Trade, State Taxes 15%, Federal Taxes 12%, Total Taxes 27%; Manufacturing as a Whole, State Taxes 14%, Federal Taxes 10%, Total Taxes 24%.

Is that not a startling tabulation? There is no dry reading in that for any thinking business man. Lest any hasty business man point out as an error that these statistics of taxation are based upon net profits instead of gross earnings, let me emphasize the vitally important fact that taxes *are* paid, not out of gross income, but *out of net profits!* This again is a point pointed out with great emphasis by this same business economist, Roger Babson.

Now then, Mr. Business Man, no matter what line of industry you may be in, is not the fact that 64 per cent is taken in taxes of the farmer's income over and above all expenses, a matter of importance to you? You are a maker and seller of merchandise. You cannot make unless people will buy and have money to buy. If they have not money to buy you must lay off employees and decrease your production—and this in turn again decreases the demand for manufacture in all lines.

I can say with every assurance—and the facts of the tax levies themselves makes the assurance doubly emphatic—that the question of our obsolete and unscientific tax systems in our states *is the most serious problem now confronting our national business life!*

What is the answer?

Look over that tabulation of the per-

centages of our tax levies. Practically all of those taxes are levied against the things that the farmer produces—the products of his labor—the very things that we need most in our national business life. Practically all of these taxes upon business and manufacture in all its forms are levied against the things that are produced by business men and industry. In other words our tax system—obsolete and destructively unscientific—is based upon heavy imposts, placed upon the very products of industry and labor that are the life blood of our nation and the definite objects of our industrial life. We are constantly taxing ourselves and our farm and industrial life out of prosperity and into hard times. And then, in fact, we are apt to regard hard times as a necessary recurrent event and entirely normal!

Who is responsible for this? The business men and manufacturers of the country? Hardly! They are not stupid even though they may be thoughtless in the field of tax economics. The business men and manufacturers have, however, supinely accepted their tax laws and systems from the politicians; and they have been helpless because they have never given any thought to taxation as a scientific subject capable of scientific analysis and through which prosperity can be sustained in industrial fields.

I do not care what field of industry you may suggest, it feels the destructive effects of our present tax systems and methods, directly as to its own plant and products—which, thereby, have to add in the amount of the tax to the price. The farmers furnish an excellent illustration of our economic tax chaos because, with 40,000,000 of them paying 64 per cent of their annual surplus investment and purchasing power in unscientific taxes, the loss to industry in the annual purchasing power of this *one* group alone, is staggering. Business feels it.

Look what it means to those industries that furnish all forms of machinery and fittings to manufacturers—for if those manufatcurers sell less to farmers, they in turn can buy less. If new industries need funds for important enterprises, or established ones need funds for expansion, the available investment capital is depleted by 64 per cent of its availability from the farm group alone. This staggerng loss of purchasing power affects similarly and adversely the lumber men and furniture and wood manufacture of various lines, the machinery and the metal trades of all kinds, the textiles, the shoe and leather and hide industries, the clothing making trades, the industries that make the little luxuries and conveniences of living—do you think that a 64 per cent tax drain out of the profits of farming that farmers buy musical instruments or candy or ice cream for their families when they come to town? Not likely, is it? And then this backs up on the manufacturer in the big industrial centers and upon *his* workers. They have less to manufacture in all lines for there is less that can be bought.

I cannot help quoting Roger Babson again—for he is no visionary doctrinaire but, on the contrary a practical business and financial analyst whose word carries weight in practical business and financial fields. "Everything possible," wrote Mr. Babson, in a recent issue of Forbes Magazine, "should, therefore, be done to impress upon the people the real facts about taxation—that it menaces both rich and poor, the well-to-do and the middle class. But short-sighted and woolly-witted taxation is a scourge that preys upon all of the people all of the time."

So great an authority on economics as Professor Irving Fisher, at the head of the Department of Economics of Yale University, has stated that the country should free industry from taxation and raise our taxes in a scientific manner.

Professor Gunnison Brown of the University of Missouri, perhaps as keen a student of industrial economics as the country possesses, also a professor in the field of economics, has stated that our present unscientific system of taxation is more Socialistic than Socialism itself and not only tends to the destruction of business and industry—upon which our taxes are levied—but is responsible directly for the periodic hard times that business men talk about but are doing nothing fundamental to correct. These are high authorities and worth listening to.

What are the business men of serious thought going to do about it? Are they going to continue to trust the politicians with unchallenged power to continue to tax business and industry to a famine out of the political ignorance and tradition out of an unscientific past? For, as every business knows—or can easily learn—the politician's invariable practice is to levy a tax against industry whenever it becomes industrious and helps thereby to build up and maintain our national prosperity!

You know, I should like to hear a few expressions of some business men on this subject. Just drop me a line.

Krapf, 421 Orange street, Wilmington, Del., $4,000.

MORTAR

Its Importance to the Mason and Builder in Obtaining Best Results in Brickwork

Mortar is the plastic mixture of two or more materials which is used to bind individual bricks together into a solid mass. Its composition, preparation and use is as important in producing good masonry as is the quality of the brick itself.

To be properly equipped in knowledge and skill to produce the highest type of brickwork should be the desire of every one having this work to do.

Submitted by The Common Brick Mfrs. Assn.

Mortar Composition

Ingredients of Mortar

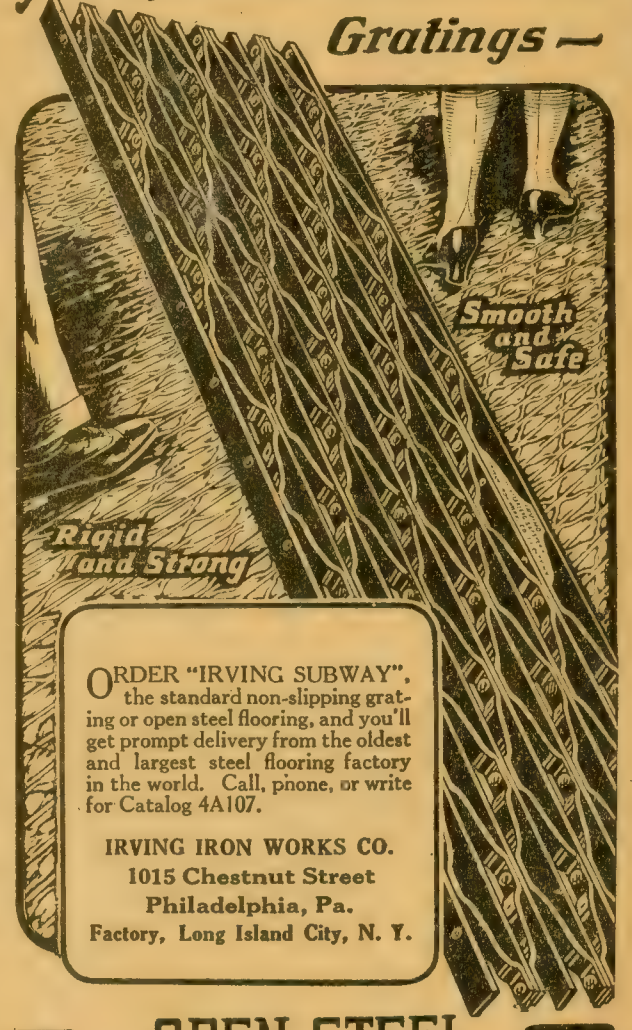
Mortar, as generally used in brick masonry, is some mixture of sand, lime, cement and water. It may contain all of these substances or only three of them and the quality as well as the quantity of each substance may vary. The characteristics of each ingredient is given below.

Standard specifications for each of the solid ingredients have been adopted or recommended by the American Society for Testing Materials and may be found in their book of standards. In some large jobs, materials are rigidly specified and carefully and accurately checked. But, in most jobs, the purchase of materials from reliable sources is sufficient guarantee of quality.

It is then only necessary to see that they are properly mixed to produce the desired mortars and to then see that the mortar is properly used to obtain the right kind of brickwork.

Cement

The first hydraulic cements used in this country were *natural cements,* manufactured by the calcination of argillaceous limestone containing sufficient silica, alumina and iron oxide to confer hydraulic properties when the burned rock was pulverized and gauged with water. These natural cements, though used for years, have been almost completely replaced by Portland cement, which is much more uniform in composition and behavior.



Modern methods of manufacture produce Portland cement of very uniform physical properties and behavior, although the chemical composition may vary slightly.

Natural cements set more rapidly than Portland cements and are slower in developing strength. The strength of 1:2 natural cement mortar is about equal to that of 1:4 Portland cement mortar.

Lime

The name "lime" is generally used to mean "quick-lime." It is also used to embrace "hydrated lime." Chemically, lime is calcium oxide, but in a broader sense it is the class name given to a wide variety of products manufactured by the calcination of limestone, which consists

of heating to expel the carbon dioxide. The resulting product is quicklime.

Quicklime is divided into two grades:

(a) Selected.—Shall be well-burned, picked free from ashes, core, clinker or other foreign material.

(b) Run-of-Kiln.—Shall be well-burned, without selection.

Quicklime is shipped in two forms:

(a) Lump.—Shall be kiln size.

(b) Pulverized. Shall be reduced in size to pass a ¼ inch screen.

Quicklime is divided into four classes: (a) High-calcium; (b) Calcium; (c) Magnesian; (d) High-Magnesian.

Hydrated Lime

Hydrated lime is a dry flocculent powder resulting from the de-hydration of quicklime.

Hydrated lime is commercially divided into four classes:

(a) High-Calcium; (b) Calcium; (c) Magnesian; (d) High Magnesian.

The desired properties of hydrated lime are the proper chemical composition, fineness and constancy of volume.

Sand

Sand is obtained from banks or pits, from river beds or from the sea-shore. Pit sand, free from clay or earthly materials is considered best for mortars, although excellent sand is often obtained from river beds.

For convenience, sand is sometimes graded as fine, medium and coarse. Mortar made with coarse sand has the least percentage of voids; made with coarse or well-graded sand it possesses greater strength. Sand passing a No. 4 screen (4 meshes to the inch) is most commonly used in bricklaying. A screen with long vertical slots and narrow horizontal spaces will screen sand effectively and faster than a screen with square meshes.

Sand for mortar must ordinarily be screened. The usual *specification for sand* is that "it shall be clean and free from vegetable matter, loan, large stones and dust." A simple test for cleanliness is to squeeze some wet sand in the hand. If loam is present, the sand will retain its shape; *if not present*, the sand will emit a gritty sound and when rubbed in the palm of the hand will not leave a slimy deposit.

Mortar Colors

Natural: Mortar may be colored by using colored sand, such as ground granite or other stone. When the desirable shade can be thus obtained, these are preferable to artificial colors, for natural sands and stones usually have a permanent color and do not weaken the mortar.

White joints may be obtained with white sand, ground limestone or marble, using white cement in cement mortars.

The color of the sand, in the finished joint, will, of course, be somewhat modified by uncolored cementing material.

Artificial Mortar Colors: Great care should be exercised in selecting the proper artificial color. Mortar is strongly alkaline and coloring matter should, therefore, be chemically inert or the color may fade or run when in the wall. Mineral colors are preferable.

For cement or cement-lime mortars, *cement* colors should be used; not mortar colors.

The common practice of mixing cement, sand and color in a mortar box with a hoe is not recommended, for uniform batches are difficult to so produce. Wherever possible, it is better to weigh all the ingredients and to measure the water. If the measured ingredients can be mixed in a concrete mixer, better results will be had.

In any case, the manufacturers' directions should be carefully followed.

Mixing Mortar

The three kinds of mortar commonly used are:

Lime mortar, a mixture of lime putty (or hydrated lime), sand and water;

Portland cement mortar, a mixture of Portland cement, sand and water, and

Cement-lime mortar, a mixture of Portland cement, lime, sand and water.

Lime Mortars

Since limes are not always of the same quality, a formula for the proper proportions of lime and sand to produce the best mortar is not possible. Experience is about the only, and also the best guide.

Slaking Lime

Quicklime as such can never be used for structural purposes. It must always be slaked. And since the method of slaking is an important factor in determining the quality of the finished product, the following directions are given as a guide to those who lack experience and as a further protection of the purchaser.

Directions for Slaking: Different kinds of lime vary considerably in the way in which they behave with water. A little supervision over the operation of slaking will amply pay for itself by insuring the production of the greatest possible quantity and the best possible quality of putty. To find out how to slake a new lot of lime, it is safest to try a little of it and see how it works. Since different lots of the same brand of lime vary somewhat, and since the weather conditions at the time have a decided influence, it is wise to try a sample from each lot used, whether familiar with the brand or not.

In a bucket, put two or three lumps of lime about the size of one's fist, or, in the case of granular lime, an equivalent amount. Add enough water to just barely cover the lime, and note how long it takes for slaking to begin. Slaking has begun when pieces split off from the lumps or when the lumps crumble. Water of about the same temperature should be used for test and field practice.

If slaking begins in less than five minutes, the lime is quick slaking; from five to thirty minutes, medium slaking; over thirty minutes, slow slaking.

For quick-slaking lime, always add the lime to the water, not the water to the lime. Have enough water at first to cover all the lime completely. Have a plentiful supply of water available for immediate use—a hose throwing a good stream, if possible. Watch the lime constantly. At the slightest appearance of escaping steam, hoe thoroughly and quickly, and add enough water to stop the steaming. Do not be afraid of using too much water with this kind of lime.

For medium-slaking lime, add the water to the lime. Add enough water so that the lime is about half submerged. Hoe occasionally if steam starts to escape. Add a little water now and then if necessary to prevent the putty from becoming dry and crumbly. Be careful not to add more water than required, and not too much at a time.

For slow-slaking lime, add enough water to the lime to moisten it thoroughly. Let it stand until the reaction has started. Cautiously add more water, a little at a time, taking care that the mass is not cooled by the fresh water. Do not hoe until the slaking is practically complete. If the weather is very cold, it is preferable to use hot water, but if this is not available, the mortar box may be covered in some way to keep the heat in.

Making Lime Mortar

After slaking quick-lime into lime putty, a small quantity of sand is usually added and the mixture put aside in a pile until used. It should stand at least 24 hours before use; a week is better. When required for mortar, the sanded "putty" is shoveled into the mortar box, and "tempered" by adding water and more sand and working to a proper consistency. This is attained when the mortar slides easily off the trowel. Ageing lime paste enables it to carry more sand.

Mortar with Hydrated Lime. Hydrated lime is essentially slaked lime, purchased and delivered in the form of a fine dry powder, instead of a paste. It is sometimes used where space on the job is limited and therefore not room to preparepare and store a stock of lime putty; and also when the time and skill necessary to prepare lime putty is not available. It is more quickly and accurately proportioned than lump lime.

Hydrated lime does not require slaking. It is usually mixed with the sand and the water added. When so mixed it does not trowel so easily as mortar made from lime putty, but the working qualities may be improved by allowing the mortar or paste to soak over night. Slaked

lime (lime putty) is to be used in preference to hydrated lime, when possible.

Cement mortar. Since Portland cement is of very uniform quality, cement mortar can be mixed in any desired proportions. The preparations recommended and most frequently specified for maximum strength and other desirable qualities are:—one (1) part Portland cement and three (3) parts of sand, by volume, with sufficient water for the proper consistency. A greater amount of sand weakens the mix. A common but dangerous practice is to use more sand than specified in order to lessen the mortar cost, with a result that is sometimes disastrous.

Portland cement mortar is not plastic; it works "short."

Laying brick with Portland cement mortar is slow and more difficult and the bed joints are apt to be not so well filled as with a more plastic mortar.

Cement-lime Mortar. To produce a more plastic or easily worked mortar, lime putty is added to the cement mortar. Any desired amount may be used, but a very good mixture for all-around work, which is strong and also economical, is one (1) part cement, one (1) part lime and six (6) parts of sand. Such a mixture works smoothly and easily under the trowel and produces brickwork of high strength.

Re-tempering Mortar. Specifications usually require that cement mortars be *not* re-tempered, for the reason that, if the mortar has taken any degree of initial set, the re-tempered mortar is weaker. The quick-setting mortars are most effected. In fact, the lossof strength is roughly in proportion to the speed of mortar setting.

With a slower setting Portland cement, the loss of strength is probably not serious, if the mortar is re-tempered immediately after the initial set. It might, in fact, be re-tempered several times without seriously effecting the tensile strength, but most codes do not permit re-tempering and it is a dangerous practice at best.

With the slower-setting cement-lime or lime mortars, re-tempering is not harmful. A safe guide is that any mortar must not be used after it has passed beyond a state of slight initial set.

The process of re-tempering is to add enough water to restore the desired consistency.

Mortar Colors. The proper methods of using mortar colors are previously described under "Ingredients of Mortar."

Use of Mortar

Selecting the Mortar. Three factors should be considered; viz., the required strength and exposure of the brickwork, the cost of the mortar and the degree of plasticity, which latter also affects the speed of laying and hence the cost of brickwork.

It is difficult to lay down any hard and fast rules regarding the kind of mortar for a particular piece of work, but the following may serve as a guide.

It is difficult to lay brick on a bed of soft mortar with a joint ¾ inch thick or over. A ½ inch joint is the more common.

Lime Mortar. Lime mortar may be used for house construction above ground, except where very heavy loads have to be carried on brick piers, or where walls are much cut up by window or door openings, or in very exposed situations. While it is the lowest in cost of all the mortars, it is not recommended.

It should not be used for exterior basement walls subject to a great deal of dampness, unless the wall is thoroughly waterproofed outside, because excessive dampness, if long continued, makes it lose its binding properties.

Straight lime mortar should never be used for fire-places and flues.

Lime mortar hardens slowly and gets stronger with age.

Natural Cement Mortar. Natural cement mortar may be used in walls or piers carrying heavy loads which will not be exposed to dampness for one month after being laid. It should not be used in very exposed situations.

Portland Cement Mortar. Is recommended for piers or walls which carry heavy loads, for wet or very exposed situations, fire and party walls, work under water, brick footings, sills, chimney and parapet caps, free standing chimneys above roofs, brick steps, cheek walls to steps, brick porch and terrace floors and similar exposed locations and for use in freezing weather. It is also recommended for fire-places and flues.

It is sometimes used throughout a building. It is the highest in cost of all the mortars.

Cement-Lime Mortar. Cement-lime mortar will set in damp places but is not as weather resistive as Portland cement mortar.

It is recommended for constructing Ideal walls above and below ground.

It is also generally recommended for masonry carrying heavy loads, for all solid residence walls above footings, for fireplaces and flues, and for locations where the work is partially protected, such as veranda posts and piers.

Cement-lime mortar costs less than cement mortar but more than lime mortar. Besides being cheaper than cement mortar in production cost, its greater plasticity permits a higher brick-laying rate and therefore further tends to lower the cost of brickwork.

It should be evident from the foregoing that, while certain mixtures are recommended as constituting good cement and cement-lime mortar, any proportions of cement and lime and sand may be used. The physical properties of cement-lime mortars of all possible proportions were carefully ascertained by the U. S. Bureau of Standards. We can do no better than quote from the Bureau of Standards paper on "Cement-lime Mortars," by H. V. Johnson.

Ingredients of a Mortar and Consistency

"First, it should be remembered that the mortars under consideration consist, in general, of four ingredients—cement, lime, sand, and water. The proportions of the first three may be varied at the will of the operator. The percentage of water used is fixed within narrow limits by the composition of the mortar and by the fact that the consistency must suit the purpose for which the mortar is used. The effect of the composition of the mortar upon the water required for the same consistency may be expressed by the statement that, in general, lime paste will require much more water than will cement paste, but the water required by each will decline proportionately with increasing additions of sand. As to usage, a mortar of wetter consistency can be used for laying brick than for laying stone or for plastering, and the scratch coat of plaster for metal lath must be stiffer than the scratch coat for masonry.

Composition of a Mortar Affects Its Properties

"A mortar having a high content of cement is characterized by high strength and by a short time of set; it is also fairly workable and shrinks some on drying. One having a high content of lime will have less strength, will be slower in setting, will be more workable, but will show more shrinkage. The chief characteristic which a high sand content gives to mortar is low shrinkage, but it also results in low strength and in poor workability. An excessive amount of water may permit of easier application of a

GENERAL INSURANCE | SMITH-AUSTERMUHL CO. 5th and Market Streets, Camden, N. J. BELL PHONE, CAMDEN 3210 KEYSTONE, CAMDEN 3147 | SURETY BONDS

mortar, but at the expense of strength. The evaporation of this water may be accompanied by excessive shrinkage, or the mortar may be left porous. This high porosity is to be desired if light weight and low thermal conductivity are important; it is not desirable from the standpoint of strength or of permeability."

Recommended Mortar Mixtures

While various proportions of cement, lime and sand may be used, as previously explained, the following are widely used and are recommended for general practice. The proportions are all by volume (not weight).

Cement Mortar. One (1) part cement, three (3) parts of sand.

A very excellent mix is one (1) part cement and three (3) parts of sand, with about 10-15% of the cement replaced with hydrated lime. This mix works easier and is practically as strong as a straight cement mortar. Its cost is so little higher than the cheapest mortar as to be almost negligible in the total cost of brickwork.

Lime Mortar. One (1) part, lime, three (3) parts of sand.

Cement-lime Mortar. One (1) part cement, one (1) part lime and six (6) parts sand.

Masonry

The production of the highest type of masonry requires: first, good mortar properly mixed; second, skilled and intelligent workmanship. There are some important precautions which should be always borne in mind and are therefore given herewith.

Brick should (except in freezing weather) be well wet before laying and *laid while wet.* The greatest wall strength is thus developed. However, hard impervious brick absorb no water and are better laid dry.

Brickwork should be well protected from storm water or snow until the mortar is set; especially from water getting in the top of the wall. If this is done, efflorescence will rarely, if ever, appear.

Brick laid in freezing weather should be dry, not wet.

Mortar should be mixed warm and kept warm until used, by mixing with warm water or in a heated mortar box or both.

Special care should be used to protect the work from freezing or from storm water until the mortar is well set. A good rule is to never leave the top of the wall uncovered or unprotected.

Efflorescence

A white efflorescence sometimes appears on brickwork, especially in moist climates and damp places. Authorities agree that it is caused by an excess of moisture within the walls which dissolves the solluble salts in the mortar. Water containing these soluble compounds leaches out to the surface where the water evaporates, leaving the salts deposited on the outer surface.

The best remedy is one of prevention; if an excess of moisture and the presence of soluble salts can be avoided, efflorescence will be prevented.

An excess of water is more often due to lack of protection from the weather during construction. Mortar, properly mixed, does not contain excess moisture; that which does the harm is storm water which comes into the top of an improperly protected wall during construction.

While these soluble salts are more commonly found in the mortar, it is thought by some that bricks made from clay containing iron pyrites or burned with sulphurous fuel, may contain thes soluble salts in small amounts.

The presence of soluble salts in th mortar may be due to the quality of the sand, to impurities in the lime, sometimes to ingredients or impurities in mortar colors and also to materials in the cement. A careful selection of pure materials for making mortar is therefore very important. And even more important is the

BRICKS AND MORTAR REQUIRED

...ion of brickwork during construc-

As previously stated, efflorescence rarely occurs if the mortar used contains none of these soluble salts. But if their presence is even suspected, it has been found that the salts in the mortar may be neutralized by the addition of barium carbonate, which compound does not affect the bonding properties of the mortar.

Efflorescence may generally be removed by washing the surface with a solution of one part muriatic acid and not less than 15 parts of water. After cleaning, the wall should be well washed down with clear water to prevent the continued action of the acid.

The National Lime Association announces a change in address of the headquarters of the Association to 927 15th St., N. W., Washington, D. C.

The move is due to the steadily increasing demand for detailed information. This has necessitated expansion of both the field and office staff and a corresponding broadening of the activities of the Association, all of which required larger quarters.

A pamphlet, just issued, "The Business of the National Lime Association," describes the aims and broad activities of the Association. Copies are available upon request.

UNITED STATES GOVERNMENT MASTER SPECIFICATION FOR .. FIRE-CLAY BRICK

Circular No. 299, 2nd Edition, entitled, "United States Government Master Specification for Fire-Clay Brick," just issued by the Department of Commerce, Bureau of Standards, contains revised specifications for six classes of fire-clay brick for use by the various Government departments.

This specification was developed by conferences at the Bureau of Standards of official representatives of the various interested Government departments and of manufacturers and users of fire-clay brick. General requirements are outlined, and the requirements for each of the six classes and the methods of testing are detailed. In addition, the specification contains a definition of each class based on the requirements of the service for which the brick of each class is intended.

Although this specification was developed for the Government, it may serve as a basis for specifications for other users of this material.

Copies of this circular may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 5 cents each.

BUILDING PERMITS

Reports from 41 cities and boroughs in Pennsylvania show that permits were granted during November, 1926, for the construction or alteration of 3,224 buildings at an estimated cost of $17,645,073. The November figures show a decrease of 476 in the number of buildings and $2,741,405 in costs of construction when

*Not included in Comparative Totals.

compared to October, 1926. Sixteen of the 41 cities and boroughs reported increased volume of construction for November, 1926, over the preceding month. Erie reported an increase of $819,446, or 247 per cent over October. Lancaster was second with $139,735, or 102 per cent. Scranton ranked third with an increase of $264,986, or 94 per cent. Harrisburg was fourth, showing an increase of $252,325, or a 90 per cent gain. Allentown, Philadelphia, Pittsburgh, and McKees Rocks reported totals of building volume that showed enormous losses compared to October, 1926. The loss for Pittsburgh amounted to more than $4,000,000.

Comparisons of the building total for 11 months of 1926 with 11 months of 1925 can be made for only 20 cities. This comparison shows that building activity for 20 cities in 1926 is nearly $57,000,000 or 27 per cent, below the total for 11 months of 1925. Three of the 20 cities show building gains for 11 months of 1926 over 1925. These cities and their gains over last year are: Pittsburgh, $1,109,618, Allentown, $779,180, and New Castle, $3,015. Some of the cities showing decreases of more than a million dollars from the 11 months' total for 1925 are: Philadelphia, $43,000,000; Bethlehem, $3,000,000; Erie, $2,500,000; York, $2,100,000; Lancaster, $1,750,000; Reading, $1,500,000, and Scranton, $1,300,000.

Service

When you go to a North America agent for insurance, all you pay are the premiums. His service costs you nothing. It includes complete information on the various forms of insurance protection, practical advice on the best policies for your purposes, and inspection of your property and business risks as often as you wish it.

Consult your agent as you would your lawyer or doctor.

"The Oldest American Fire and Marine Insurance Company"

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America
write practically every form of Insurance, except life

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" **permanently** hardens and waterproofs concrete mixtures **in one operation.** Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through the freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 22 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it also for cold weather work. It will save you time and money. Write for specifications.
